"Considering this kind of poultry house from a financial point of view, it is cheaper than the old type of house because windows can be replaced in part by cheap duck curtains. In addition, the scratching shed is abolished, the roosting pen and scratching shed being combined, thus economizing in space and lumber.

"The curtain-front house remains dry and cheerful in all sorts of weather. It is true that it is a cold house in winter when the curtains are open during the day, but fowls, when properly hardened, can endure a considerable degree of cold without injury, and this is especially true if they are in a cold atmosphere during the day time when they are obliged to scratch vigorously for their grain."

POULTRY BREVITIES.

Many a hen otherwise well fed fails to lay because of a lack of sufficient water.

* * *

Without pure air in the poultry house a poultry man cannot stay long in the business, unless he has a large bank account to fall back on.

* * *

The great value of green food lies in its ability to aid in the digestion of other foods thereby promoting good health and increasing egg production.

* * *

More than 65 per cent of every egg is water and water makes up 55 per cent of a hen's body. Without a sufficient supply of water the hen can neither digest food properly nor produce eggs.

* * *

Chicks Eating Each Other.

Can you tell me what to do to prevent my small chickens from eating each other?

I have been much annoyed during the past season by my incubator chicks picking at the toes of one another until they bleed, and in some cases, they have picked at a member of the flock until he has been killed and eaten.—E. K. C.

This trouble may be due to lack of animal food. Oftentimes chickens are so hungry for animal food that they will attack each other; when the habit is once developed it frequently becomes a vice and hard to break. Supply the small chicks with plenty of animal food in way of meat scrap, good grades of which can be bought for $3.25 per hundred. If small chicks have this before them after they are ten days old they will not be apt to develop the vice of cannibalism.—S. S T.

* * *

Trouble With Three-month Old Chicks

I have a flock of 36 Brown Leghorn pullets three-months old that have been very active and in excellent health until about a month ago when the combs began to lose color. They have not been as active and are not growing well, although I feed them all the wheat they will eat and they have the range of three or four acres.—Mrs. H. M., Hanford.

From the description it is rather hard to say just what the cause of this lack of condition is in this flock of young birds. Maybe such a condition could arise from several causes. If we name some of these possible causes our correspondent may be able to decide for herself as to the more probable one in case of these chickens.

1. It may be due to an illy-balanced ration. At various times in these columns I have mentioned that no one grain supplies the food constituents needed by the system of a growing bird in the right proportion. It seems that these birds have been fed largely on wheat, an excellent food in itself when combined with other foods supplying the necessary element in which it is lacking. These birds should have meat scrap, dried blood, skim milk or other substances rich in the material in which wheat is lacking, viz., protein. The owner should see that they have mineral matter in way of bone, a supply of clean water and access to a hopper containing charcoal. But the chief deficiency is animal and mineral matter. We assume that they get sufficient green food, as they have free range.

Again, these birds may be suffering from an attack of roup. This disease often develops in a flock of young birds in a mild form not acute enough to cause much mortality, but enough to check growth and cause a generally unhealthy condition.

If they have a bad odor about the head and exude from the nostrils when you press on the side of the head above the nostril it may be assumed that roup is present. Refer to back numbers of the Cultivator for treatment.

If these birds eat well and still are losing flesh they may be suffering from what is known among poultry men as "going light." This is tuberculosis of the fowl, contagious, and there is no remedy but the hatchet for afflicted birds. The treatment is prevention by avoiding the introduction of affected birds into the flock and disinfection of all houses where such birds have been kept—these are some of the possible causes of the condition of the flock under consideration.—S. S. T.

Here is a short hard fact on the cost and profit of keeping hens. The West Virginia Experiment Station has gone through a year of work with 600 hens. The cost of feed per hen was 89 cents; total of feed and labor $142. The average of eggs per hen was 113 valued at $2.43. As will be seen each has returned a net profit of $1.01.—Hoard's Dairyman.

Yards need some sort of shade in hot weather.

PROBABLE POULTRY PROFITS.

Several subscribers, evidently amateurs, have asked me as to the possibility of profit in poultry as a business venture, or for a livelihood. So many considerations are involved that one would need to write a book to cover the ground completely. I have a few paragraphs, says a writer in Farming.

Near any fairly good market there are possibilities of good living profits. Remoteness from markets means increased risks in selling through others. The probabilities depend largely on the man—or woman. Study the available markets, see which promises best, and what is most in demand. I know of some localities where I would bend all my energies to the production of fancy brown eggs and large roosters; others where I would push for fancy white eggs and small broilers. And either would be a winner in the right location. See the point? Make a friendly call on several successful poultrymen (for there are some besides pessimists,) observe their buildings, their appliances, their methods of feeding and handling. Ask all the questions you can think of about the business. Adopt all good methods when feasible, adapting them to your own circumstances.

The most promising road to success lies along a combination of eggs and market stock. Let the fancy business be an after consideration. Market poultry and eggs go hand in hand, for the surplus cockerels go as broilers, and hens past their usefulness must be marketed. Begin with one breed; study that thoroughly. Begin small and grow into a larger business. Too many want to go into poultry on a large scale. In no other branch of live stock do returns come so quickly. To illustrate:

We had a brood of ten chicks hatched in late March. In about nine or ten weeks, the five cockerels sold for fifty cents each as broilers, enough to pay for eggs and feed to raise the pullets to laying size. In six months the pullets were ready to lay, at a time when the price of eggs was high and on the up grade. In less than a year the performance could be repeated. Suppose this brood were multiplied by 100, a number which one hustling man could care for, do you see the possibilities? But suppose, through neglect or otherwise, half that brood had been lost, what a difference in results! But again let me advise increasing moderately.

Yes, there are great possibilities in the poultry business on small capital, with the probabilities in favor of the careful, painstaking, observing man, with an almost unlimited faculty for attention to details.

I have had in mind in the above simply fowls. That will be enough for a starter. One thing at a time. Ducks, turkeys, guineas, possibly pigeons, may be added later.

TESTING EGGS.

A perfectly fresh egg placed in water will lie upon its side; if the egg is a few days old the large end of the egg will slightly rise in the water; the whole egg being tipped at an angle with the bottom of the dish. This angle increases with the age of the egg until an egg that has been kept some time will stand upright in the bottom of the dish. This does not indicate that the egg is spoiled, but that it is old or "stale." If it is spoiled it will float in the water. Another method of testing eggs is to hold them between the eye and a strong light, in which case the egg, if fresh, will appear transparent around the sides with the yolk showing dark in the center.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full directions for feeding and care of poultry from the time they are hatched, together with care of sick chicks. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Egg-More

Not a strong tonic and stimulant, but a highly nitrogenous Poultry Food very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs when they are scarce and high. If not sold by your dealer, we will prepay freight on 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs., $7.00. Send for free Booklet with testimonials.

$50 Cash Premiums

$20 first; $10 second; $5 third; fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you and no peddling or canvassing. And to each one competing, we will also give a useful article. Send postal for particulars mentioning this paper, to

Poultry Ranch Wanted

Anybody having a small chicken ranch to sell might find a buyer by writing Box 585, Ontario. Give full description, price and terms in first letter

Fowls that are expected to lay must have plenty of exercise. If they have nothing to do they will eat and become too fat.

DISEASE CAUSED BY CLOSE HOUSE.

Last autumn a friend, having raised a thrifty flock of pullets, built a snug house, close and warm. It had the proverbial glass windows on the south side, with a view to the comfort and happiness of those pullets, and incidentally with a view to securing those much-desired winter eggs. A fine house those pullets should have. As the nights began to grow cool, he moved the flock from their open-front airy coops to this hen palace. Visions of baskets upon baskets of hen fruit cheered him on. But, anon, he came seeking eggs, and found none. Instead he found numerous sick birds, drooping, wheezing, some with swollen eyes and decidedly roupy tendencies. This was certainly discouraging. And he had been so good to them, too. Aye, there's the rub. He had been too good. The change to that close, warm house after spending all their lives in those airy coops, had done its work. Too great a change! Too little fresh air. Ventilation should have been provided, or better still, cloth instead of glass should have been used in those windows. Fresh air is cheap and conducive to heath. Why not have more of it? I know how this change affects pullets, for I had the same trouble years ago when I didn't know better. And there are others.

PROTECT THE DOVES.

A friend has sent me following, clipped, we think, from a Pasadena paper and written by Dr. Hunt of that city:

Since, permitted by an unfortunate game law, gunners are now shooting doves, some words upon the habits of these beautiful and gentle birds may perhaps be of interest. No ranchman can accuse doves of spoiling any fruit; here is a negative virtue. But, according to Wm. Dutcher, a high authority upon birds, "Recent investigations made by the Biological survey, U. S. Department of Agriculture, of the food of the dove, prove this bird to be of incalculable value. * * * Its principal and almost constant diet is the seeds of weeds. These are eaten at all seasons of the year. They constitute sixty-four per cent of the annual food supply, and show very little variation during any month. Some of the seeds eaten were so minute it would seem that none but the smallest of birds would eat them, and then only when driven to do so by lack of other food.

"Some instances of the enormous number of seeds that individual birds consumed will be of interest. In one stomach were found 7500 seeds of the yellow wood-sorrel, in another 6400 seeds of barn grass or fox-tail. * * * The three doves in question benefited the farmers, on whose land they fed, by destroying 23,100 prospective weeds at one meal.

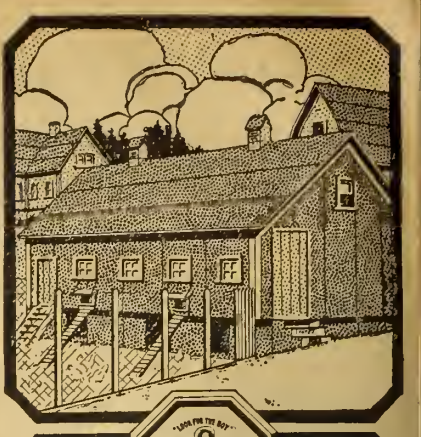
"Is there a farmer in this land who would not welcome as a friend the man who would offer to uproot and kill 23,100 weeds? Yet because the doves go about silently and unobtrusively, and make no loud boasts about the good they are doing, they are thought of little or no value. In many sections of the country this valuable, harmless and gentle creature is considered a semi-game bird" (Shame on California! "and is shot during a large part of the year.

Would it not be true economy for ranchmen to post their land with the muslin "No Shooting" notices to be obtained gratis from Mr. W. Scott Way, Glendora, Cal., or the Pasadena Humane Society, and to see that these notices are respected?

"It is a question for the ranchers to settle whether they will permit anyone to kill on their land birds that annually destroy tons of the seeds of pigeon-grass, ragweed, smartweed, bindweed and many other noxious plants, and are thus worth so much as helpers on farms. The matter resolves itself into a question of figures, i.e., dollars and cents to the farmers. If three doves at one meal destroy 23,100 weed seeds, and thus prevent the growth of the same number of prospective weeds, how much good will all the doves on a farm, or in a State, or in the country at large, accomplish? Or, to present the case in another way, how much will it cost in time, labor and actual cash, to destroy what the doves would eat if they were protected and encouraged to remain on the ranches?

"The farmers in the United States spent in 1899, the enormous sum of $365,305,921 for labor; how much of this was paid for killing weeds, and how much of it could have been saved if no doves had been killed, but all had been protected and permitted to perform their work?"

It is greatly to be hoped that there may be a new game law shortening the dove season which now opens before nesting time is really over, a time when all creatures are entitled to protection. As they lay but two eggs, sometimes only one, there is no possibility of their too rapid increase. But there is no reason why the dove should ever be considered in any sense a game bird, nor why it should not be accorded complete protection, along with the mockers and song birds.



Profitable Poultry

A high or low death rate is usually the difference between successful and unsuccessful poultry raising.

REX Flintkote ROOFING is used for roofs and sidings on profitable poultry plants, because it keeps the houses warm and dry, with even temperature and humidity.

As a result, fewer chickens are lost and the layers are more productive in poultry houses covered with

REX FLINTKOTE ROOFING

This roofing is fire-resisting, rain and snow-proof, and very durable. REX Flintkote ROOFING affords more kinds of protection to your buildings and their contents than any other roofing. Everything needed in laying comes with the roll—any laborer can lay it.

SEND FOR FREE SAMPLES

Let us send you free samples to test, and our roofing booklet. Our valuable poultry book, "Making Poultry Pay," sent for 4c. in stamps.

Laying hens are the paying hens.

Poultry needs a varied bill of fare.

Yards should be as large as possible.

Pick out the cull chicks and market them.

Poultry pays when a hustler is behind it.

Try and keep the chicks free from lice.

Wash out drinking vessels before refilling.

Fowls kept in yards need plenty of green feed.

Lazy people never make a success with poultry.

Setting hens want good feed and plenty of water.

Eggs intended for hatching should be of an even size.

Resolve to take better care of the poultry and do it.

Either you keep the poultry or the poultry keeps you.

Often the grit hopper becomes empty. Better look!

Air-slacked lime dusted freely on the chicken yards is one of the best preventives of gapes in young chickens.

Small Fruits and Vegetables

BLACKBERRY ORANGE RUST.

This trouble is very prevalent in some sections of the country, the cloudy, rainy weather seeming to favor its development. J. C. Whitten, of Missouri Experiment Station, says it is caused by a fungus which starts in the young canes below ground, pushes upward in the new tissues of the cane as it lengthens and then ripens its spores again about this time of the year, forming the red rust from which the disease takes its name. The red, rusty looking powder is the spore masses being shed from the under part of the leaves. The disease is perpetuated by means of these spores, which answer to seeds. They usually get down into the ground, however, and enter the plant below ground, so the fungus gets its start below the soil, where it is not possible to prevent it by means of spraying.

Though it is not feasible to get out the thing by means of spraying, one can in a measure keep it out of a blackberry plantation. The first thing to do is to dig up and destroy all the infected plants as early as possible. When this can be done just before the red spores begin to shed, so much the better. It is best to dig out the infected plant root and branch, as part of the fungus will remain in the portions of the plant below ground.

Plants which are shaded are more likely to be infected than those which are not. For that reason it is helpful to prune any overhanging trees sufficiently to let in sunlight where it is feasible. In order to avoid shade it is also well to remove the old canes as soon as they have fruited this season, so they will not shade the young canes which are getting ready to fruit next year. In late winter and spring pruning of the fruiting canes it is best to cut side branches back to from four to six inches in length until you get the patch free from the disease. In other words, prune so as to let in a little more sunlight than normally would be done for a season or two.

While especially in a small home plantation, it seems like a sacrifice to dig out parts of the planting, it pays to do it, as infected plants will not bear any fruit and will only stand in the way and help to communicate the disease to those which are not infected.

CABBAGE WORMS.

Paris green, one rounding teaspoonful. Common flour, one quart.

Mix the two thoroughly together and put in a small cheesecloth sack which anyone can make in a very few minutes. Shake this sack over the cabbage plants, causing the Paris green and flour to sift through and fall upon the cabbage leaves. This is best done early in the morning or in the evening when there is a little moisture upon the leaves to cause the powder to stick where it falls. A very light dusting is all that is necessary to distribute enough of the poison to kill the worms that feed upon the leaves. This poison should not be used later than ten days to two weeks before the time that the cabbages are to be gathered.

Unless used in unreasonable excess, there will not be poison enough deposited upon the edible part of the cabbage head to do any harm. In fact, all these outer leaves are removed before the cabbages are cooked for food. It is also true that the leaves that form the outer part of the cabbage head one day will spread and become loose outer leaves a few days later. So, if the poison is not applied very near to the time that the cabbages are to be gathered, there will be no poison whatever upon the edible parts. For best results the first application should be made as soon as the heads begin to form. Then one or two applications later would be all that is necessary.

In large fields it might be better to use the Paris green in the form of a spray of water. In which case a little soap should be added so that the liquid will spread over the leaves and not roll off. If used as a spray, mix one pound of the Paris green in each one hundred gallons of water. Arsenate of lead may be used instead of the Paris green, in which case five pounds of the poison should be used for each one hundred gallons of water.—C. P. Gillette, Agricultural College, Colorado.

The bean section of Ventura county will be better supplied with threshing machines than in the past. One of the greatest losses there has been from lack of machines to thresh the beans before the rain or wind damaged them.

In harvesting beets pull out and cut the tops or twist off. Don't cut the top of the root off.

SOME SHASTA COUNTY ONIONS.

Mr. A. P. Henning of Cottonwood, Shasta County, sends down a few onions, busters, some of them nearly 6 inches in diameter, each top entwined and embraced, sufficiently, it would seem, to smother its life, with morning glory vine. But nothwithstanding that Shasta County soil has conquered and given a big growth. Mr. Henning writes:

"I am sending you by express a sample of onions grown in morning glory land. If you can beat it in Los Angeles I'll gladly pay for the sample. I had tried a good many things that utterly failed on this same ground, but these "Gibralter" onions hold the fort. They have only been hoed twice and plowed twice, and the glory has entwined itself pretty well, as you will see by the sample I am sending you. If any one is doubtful of this story all they have to do is visit the patch and if they don't find it a fact we will pay their expenses of the trip, only we would have to limit it to thirty days, as we expect to have them out of the ground in that time."

A more desirable crop would be something which would smother the morning glory entirely. If that cannot be, then try "Gibralters."

THOSE ARE PUMPKINS.

"GREENS."

Many people who are successful with their family gardens for most of the summer vegetables either neglect or fail of success with the various things commonly known as greens. As these all make very wholesome dishes, especially to those who eat little fruit, it would be well if they gave more attention to them. What I refer to especially are lettuce, mustard, spinach, turnip greens, etc.

I notice that in very few farmers' gardens are any of these things to be found in the fall, though most people raise them in the spring. We don't like to be without something green from the garden any month in the year.

I especially recommend spinach as a kind of greens that may be eaten by many people who do not find anything of the cabbage kind digestible. To me personally the slightly bitter taste of turnip greens and mustard is more pleasant than spinach and fully as digestible, but many do not find them so. So that while these other greens are popular and sell well in most markets the demand is not so good as for spinach, nor the price so high. But getting a stand of spinach often proves to be difficult. I have found the safest plan to sow just before a rain if it can be done and cover lightly. Or if sown when the ground is as moist as can be handled and the soil firmed, the seed will come up.—G. R.

Vegetable growers near Stockton are planning an educational campaign with restaurants and hotel keepers by which they hope to induce better and more general preparation of vegetable dishes for the table.

Bermuda Grass.

Kindly advise me where I can buy the seed of Bermuda grass.—E. G., Ceres.

This is the first request, we believe, of this kind which has ever come to the Cultivator office. There are some sections of the Southern states where Bermuda grass is sown as a pasture grass, but in California it is so universally considered as a pest, and as a serious pest, that the usual inquiry has been, "How may I get rid of it?" The seed sown will scarcely ever germinate, so that it is seldom used in the Southern states for propagation. The method there of starting a field of it is to mow with the machine in a pasture already covered with it. This freshly cut grass is run through a feed cutter and cut into pieces about an inch long. These are sown over the prepared ground and harrowed in, very much as seed would be.

Galled Shoulders.

In answer to a query by F. N. of Holtville, regarding galled shoulders of his horses, Mr. M. H. Ovaitt of Pomona sent us the following: "If Mr. N. will open the sweat pad on the side that lies next the collar and pull out all the stuffing at the spot over the sore, scrape the spot on the pad to soften it and put on a good layer of axle grease, the sore will get well."

It will be remembered that this is contrary to Dr. Whittlesey's advice, for he said in all cases to keep grease from the shoulder while the horse is working. However, we give the above and thank our subscriber for sending it in.

Barley.

Is this weather too hot to sow barley for pasturage in September? If too hot for barley, then what could be grown? Our place is in the foothills, a sandy loam.—A. L., San Bernardino.

If you have sufficient water to put the ground in moist condition and the ground is thoroughly pulverized after irrigation, you should be able to get good early pasturage by sowing your barley now. It would probably be necessary, however, to leave the land so as to irrigate after the seed comes up. Your further question regarding peaches coloring will be referred to Mr. Mills.

Poll Evil.

Please give remedy for poll evil.—S. R. M., Thermal.

We refer you to live stock department of this issue, where there is an article on poll evil and fistula.

Peddling by Grower.

Can city authorities legally demand a license from a farmer who peddles his own products? It is often demanded by the former, yet farmers invariably denounce it as unconstitutional. If such a license cannot legally be collected what course should the farmer pursue to obtain his rights.—Subscriber, Newport Beach.

This query has been referred to attorneys who say that each city has authority to control its own license laws. However, one attorney believes that if tested every farmer has the right to sell his own products without paying license. The city of Los Angeles demands license of all, whether growers or simply peddlers of farm products. We believe if we had products to sell we should test the matter by refusing to pay a license for selling anything produced on our own farm in this state.

Hard Milker.

I have a Jersey heifer; freshened a few days ago; has good shaped udder and large teats, but is a hard milker. Is there a remedy?—A. L. S., Imperial.

This does not give particulars enough. This heifer may simply be nervous or she may have small teats. If she is simply a cow that does not milk easily we usually give such an animal her calf and when it is a little too old to take the milk, give her another one to raise, and then let her dry off naturally. When she comes in again the hard milking quality is gone as a rule.

Cow Peas.

Please inform me how many cow peas per acre are required for green cover crop. Also how much vetch seed; and which would you advise planting in a one-year-old peach orchard, simply for fertilizer, and to keep the ground from packing?—J. S., Sanger.

We would surely plant the vetch or else Canadian field peas, as the cow pea, or more properly it is a bean, does not do at all well in this state, especially during the winter season. The vetches and the Canadian or field peas have succeeded very well. As to amount of seed and other factors we expect to give an article on this topic within the next few weeks in the Cultivator.

Commercial Fertilizer.

What is the proper kind of commercial fertilizer to promote the growth of lemon trees? Also to increase the crop of fruit?—J. B., Corona.

The answer to that question would depend on several different things which could only be determined by an examination of conditions. In a general way we would say if the mechanical condition of the soil is perfect, that is, if it has sufficient humus to give it life and put it in the proper condition for admitting the air and water, then the application of a complete fertilizer would be the simplest answer to the question. Too often, however, farmers feel that the commercial fertilizer which contains all the elements that the plants need, is all that is needed to put upon the soil to bring a big profit. The farmer must learn that the simple chemical content of the soil is but the first step in fertilizing trees. The temperature of the soil, admission of air and water, subsoil and other conditions, are fully as important as is the chemical content. We would refer the inquirer to an article appearing in the Cultivator of May 14 on "Maintaining Fertility in the Orchard," by Frank L. Palmer. It will give far more information than is possible in this column. As to the need of a lemon crop, the analysis of the fruit might show it to require a slightly different proportion of the three principal elements than would other crops. But we believe this slight difference is altogether too fine to be of much practical value to the everyday farmer.

Lippia.

I wish to inquire about the lawn plant, Lippia repens, recently mentioned in the Ornamental Garden Department. Where can the turf be obtained and when should it be started?—W. H. K., Lemon Cove.

Almost every nurseryman and plant dealer in the State should be able to supply you with Lippia repens, as it is becoming very common. Or, if a neighbor in the same section has a lawn of it and will permit the taking of a few plants, one may with a plant trowel take sufficient for a small lawn in a few moments and leave only small holes here and there, which will soon fill as the surrounding plants which are left will grow and cover. The quickest results we have seen with covering after planting was when the plants were put out early in the spring. The warm weather started the growth at once and in a short time the entire surface was covered with a new growth. Some which were planted in January took root and grew during the cool part of the season, but the growth was, of course, much slower than later in the season. If planted now and given plenty of water it will be thoroughly rooted before the cooler weather comes.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Milk Fever.

My cow recently calved one morning. The calf stayed with her all day and the next morning she came in and ate as usual and was milked. At noon she was down and never got up again. Did not seem to suffer much pain, but her eyes were set. She was a full-blooded Jersey and a fine butter cow. Had all the hay she could eat. Was in ordinary flesh.—F. A. C., Gridley.

We think you have given pretty nearly a perfect description of milk fever as it ordinarily affects a heavy milking cow. Had you used the air pump treatment charging the udder full of sterilized air we doubt not you would have an excellent cow doing service yet. The application of this remedy is exceedingly simple and the few dollars which the apparatus costs should impel every dairyman to have it on hand for just such an emergency. Even the common bicycle pump has been used in such emergency, with best results.

WHITTIER FARMERS' CLUB.

After an excellent luncheon served at the East Whittier Woman's Club House on Wednesday, August 5, an excellent program was given during the afternoon, and another step taken toward organizing a farmers' club. Mr. J. M. Randall acted as chairman of the meeting and Mr. Patridge as secretary. After excellent music Mr. Randall called the meeting to order and gave a short talk on the advantages of the farmers' clubs. F. W. Knight, manager of the Lemon Packing House, gave some excellent points on the manner of handling citrus fruit. One of the points which he made was that there should be no farming by proxy. In other words he had noted that the best fruit which came into the packing house was from the ranches of those farmers who lived with their trees, rather than from those owned by non-residents.

The principal talk of the afternoon was given by Prof. R. S. Woglum and illustrated with charts. It was treated of more largely on the first and citrus pages of last week.

Professor J. H. Norton of the state experiment station force, who has recently been transferred to California, gave a short talk on purchasing commercial fertilizer.

Geo. M. Lambert, of East Whittier, representing the vegetable growers, talked principally on the advantages of the greatest care in selection of the best of seeds. He advocated saving one's own seed, which should be selected from the first and choicest of the crop. He said seed men often bought most of their seed, sometimes from unprincipled growers who sold the finest and best fruit and saved seed from the culls.

Professor Ramsey gave a talk on tomato blight and urged that tomato growers either reduce the acreage or be prepared to spray, immediately after every rain, the entire patch and to do it thoroughly. Or else he must spray at stated times regardless of the weather. To be safe he thought three times during the season would be necessary.

T. L. Gooch, of Rivera, gave a talk

on walnut bleaching by a new electrically treated salt water process. He had nuts which were well and uniformly bleached and stated that the Los Nitos Growers' Association was preparing to use the method this season.

Professor Smith spoke of the black smut and blight on walnuts. In referring to the walnut blight he warned growers not to feel assured from this season's immunity that the disease would not return next year. The disease is affected by weather conditions and the weather this year has favored the formation of the honey dew or smut, while unfavorable to the blight.

The organization of the club was not perfected. The chairman of the organization committee reported recommending it, but also that a set of by-laws be drawn up before the election of officers be held.

BALING HAY FROM THE FIELD.

I have made quite a success of baling alfalfa from the field and have been able to top the market with the last three cars I shipped. The only trick I find in baling alfalfa from the field is in the drying process. The hay must be very dry before baling. I use the Dain side delivery rake when the hay is about one-half cured, and this should lay from one to three days before it is safe to bale directly from the field. The time depends largely upon wind and the kind of haying weather we have.

Moldy alfalfa is rank poison to horses and of not much value for cattle. It is best to get the hay perfectly dry even if some of the leaves are lost, for as long as the hay is green and damp alfalfa mold will grow when summer heat prevails. Never store green or damp alfalfa in a shed or it may burn down by spontaneous combustion.—Field and Farm.

The soil is the stomach of plants. In the soil the food is received and digested. On the quantity and quality of food put in the plant's stomach depends its welfare, just as much as you depend upon the food in your stomach.

San Francisco offers great opportunities. Prepare for them by taking a course in the San Francisco Business College, 733 Fillmore St., S. F.

Lodi winery is crushing 600 tons of grapes a day.

The Ornamental Garden

IMPROVEMENTS IN LILY CULTURE.

THE growing of lilies in the United States is rapidly becoming an important industry. Large quantities of bulbs have in years past been imported from Bermuda, Japan and other countries, and the demand for the flowering plants seems on the increase. Various lines of work have been undertaken and carried out by Mr. Oliver, chiefly for the purpose of securing new types of lilies by hybridizing and crossing and to demonstrate the practicability of growing lilies in the United States directly from seed.

One of the most promising hybrids has resulted from crossing the Philippine lily (Lilium Philippinense) and the Bermuda lily. The Philippine lily takes two months to come into bloom from the period of planting the bulb, while the Lilium longiflorum and its various forms require in the neighborhood of five months. Therefore, it would be a great saving if the time taken to force a good Easter lily could be reduced from one to two months. With a view to bringing this about the hybridization of the Philippine lily and the harrisii variety of the Lilium longiflorum has been effected. The result of the cross is a flower longer than that of harrisii, but not as broad, and a little shorter than that of the Philippine lily. The segments of the flower of the harrisii are from 5 to 6 inches long. Up to this time we have had to depend upon the Philippine Islands for the supply of the Philippine lilies, and they arrive early in the spring when we can not use them for forcing. By growing them in California we can get them in the fall in good time for forcing into flower during the winter. The plants so far grown in California do not show signs of the lily disease.

The second line of work in connection with the production of lilies has been under way for the past four years. It consists, first, of selecting plants which show freedom from disease as manifested by spotted leaves and distorted flowers. The varieties selected are those well known under the names of multiflorum, harrisii and giganteum. When these plants come into bloom the flowers are cross-fertilized, with certain purposes in view. The seeds from these plants are sent to California and other places about the end of the summer. They are planted out in the field in the following spring and in a year from that period the growth made by the seedlings is so great that hundreds of plants have been recently produced bearing in the neighborhood of thirty flowers to a stem. As one would naturally suppose, disease is not anything like as prevalent in these California-grown plants as it is in Bermuda and Japan, the present sources of supply of bulbs used in the United States. So far as the work has gone the results have been very encouraging, especially in Southern California, so that we are reasonably certain that the supply of bulbs will in due course of time be produced within our own borders.

There is a large tract of country with soil suitable for lily growing in the southwestern portion of California, from Santa Barbara down and extending inward for several miles. The bulbs can be harvested by the first of August. Some of those produced during the past season from two and three-year-old plants are very large and satisfactory. Among some bulbs recently received by the Department of Agriculture, was one which measured 14½ inches in circumference; others closely approximated this size. It would seem that the method of reproduction by seed, saving desirable types from the seedlings and propagating those only by division and not from scales, is the true solution of the problem confronting the Easter lily industry in the United States. Should it be found practicable to fix any of the varieties so that they will come absolutely true from seed, then the method of procedure will be facilitated.—Yearbook of the Department of Agriculture, 1907.

A PUBLIC PARK IN COLUSA.

When planting trees and shrubs on the lawn keep in mind the habits of the trees. Remove all broken roots, when trees are set, with a sharp knife. Make the top smaller than the roots.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. R. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles, Cal.

FOR SALE—SECONDHAND PIPE AND oil well casing, all sizes, any amount; boilers and engines; gas and distillate engines; pumps, etc. Get our prices before you buy. A. CANNADY & CO., 1029 N. Alameda St., Los Angeles, Cal.

FOR SALE—25-H. P. FAIRBANKS-MORSE Gasoline Engine. Good as new, also pump. BAILIE & BRANDT CO., 943 N. Main St, Los Angeles, Cal.

ADDISON DEEP WELL PUMPS WITH gasoline engine, new, and one engine slightly used, at a bargain. 117 BRUNO ST., Los Angeles, Cal.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD. Box 6, Compton, Cal.

FOR SALE—2 AND 3 IN CENTRIFUGAL pumps at a bargain, new; also gasoline engine. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

FOR SALE—GASOLINE ENGINES, 6-H. P. International. S. J. CORNELL, 1136 Irolo St., Los Angeles, Cal.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

ORCHARD HOMES FOR SALE—FIVE acres and upwards; fine citrus and deciduous fruit lands on easy instalments and low interest. Write us today. Wyatt & Wilson, WINTERS, Cal.

EGGS FOR HATCHING.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

POULTRY

BUFF ORPINGTONS—WOULD YOU LIKE the very best at the price of common stock? Sullivan's COMMONWEALTH STRAIN you may have at HALF PRICE FOR THE BALANCE OF THE SEASON. Write us and learn the reason; get record and illustrated catalogue FREE.—MR. & MRS. W. S. SULLIVAN, Agnew, Santa Clara Co., Cal.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

WANTED—ORDERS FOR EUCALYPTUS trees for spring delivery. Write for prices. Seed of the Rostrata and Sugar gum for sale. ENCINITAS FLORAL & PRODUCE CO., Encinitas, Cal.

NURSERY FOR SALE.

OLD ESTABLISHED NURSERY BUSINESS for sale. Good stock. Good location. Good reasons for selling. Address THE AUBURN NURSERIES, East Auburn, Cal.

An interesting feature of the September Century will be a discussion of "The Future Wheat Supply of the United States," by Edward C. Parker, assistant in agriculture at the Agricultural Experiment Station, the University of Minnesota. Mr. Parker will present with authority existing conditions in the United States and outline some of the many means at hand to meet the future demands for wheat. He declares that the science of agriculture is still in its infancy, and that the limit of its present possibilities will be set aside by a new limit set by each succeeding generation.

A CHARACTER SKETCH.

I knew a man who thought he knew
it all;
He knew how earth became a rolling
ball.
He knew the source and secret of
all life;
He also knew how Adam came to fall.

He knew the causes of the glacial
age,
And what it was tnat made the deluge
rage.
He knew—in fact, he knew most
everything;
In his own mind he was earth's great-
est sage.

His knowledge was of such stupendous
girth
It took in everything upon the earth
And in the heavens; but, most
strange of all,
He didn't know a thing of real worth.

He knew where people go when they
are dead,
He knew all wonders ever sung or
said.
He knew the past and future; but
for all
He didn't know enough to earn his
bread.

He was a marvel of omniscience,
He knew the secret of the hence and
whence.
He was a bundle of great theories;
The only thing he lacked was common
sense.

A TICKET SCALPER'S STORY.

I'M A ticket scalper. It's not much of a business and doesn't give a man much of a position in the world, but a scalper has a human heart, just like any one else. A scalper may feel inclined to bestow that heart upon a woman. I had that inclination once, but I'm never going to have it again. Women are the most ungrateful creatures in the world. A woman who would treat a man as one of 'em treated me isn't fit to live on the face of the earth.

One day a pretty, melancholy-looking girl of perhaps twenty-two came into my office and said she wanted to get to her mother, who was lying sick in Cincinnati. She said she was broke and wanted a ticket for about nothing. I had half a mind to give her a ticket, charging up the amount to myself, but that would be giving a stranger something like $10, and, while, as I said, a ticket scalper has a heart, he isn't the kind of a man to give things away that he can't afford to give. I was looking among my old stock for something pretty cheap when I came across an unused half of an old excursion ticket, the limit of time of which had long ago expired. It occured to me that if the girl worked on the sympathies of the conductor as she had on mine she might induce him to pass her through on it. I told her what I was thinking about and that if she was inclined to try it on I would give her the ticket free of charge. She asked if there would be anything dishonest in such an act, and I told her I didn't think there would be; there would be no misrepresentation. If the conductor wouldn't accept the ticket the worst he could do was to put her off at the first stop and she would be just so far on her journey. If she got stranded in a strange place she could get on the next train and go farther on the same ticket, and so on.

She said she wouldn't do that, but if the conductor would let her go through on the ticket she would do so. The ticket had been paid for by some one, and she didn't think the road had a moral right to refuse it. I agreed with her as to that, and she accepted the ticket with heartfelt thanks and tears in her eyes. She looked hungry, and I asked her if she was going through without anything to eat. She said she'd have to, and I felt so sorry for her that I asked her to go out to a restaurant and filled her up with oysters, beefsteak and a lot of other things. I remember the bill was $3.50. Her train went at 12:05 o'clock, so I took her to the theater. If you want to love any one, just do something for 'em. The more I did for this poor girl the more I thought what a lovely home she could make for me. By the time I left her at the station I would have bought her a good ticket, but I'd spent all my money. I told her to keep up her courage and she'd go through all right. She said that I was one of nature's noblemen and I would be rewarded for my kindness to her. As the train moved away she waved her hand to me out of the coach window, looking at me with tearful eyes.

It wasn't a week before I received a note from the attorney of the road over which I'd given the girl a ticket stating that they had a case against me for swindling and must either shut up my shop or they would send me to state prison. I went at once to the attorney's office and asked to know what it meant. He showed me the ticket I had given the girl with a sick mother and asked me if I'd sold it to a deaf and dumb girl. I denied the charge and admitted I'd given it to a girl who could talk as well as I could. Then he told me how the ticket had been used.

The girl had poked it at the conductor when he came around, and he told her it was no good. She began to talk to him with her fingers, and seeing her condition, he had given her a pencil and paper on which she wrote that a ticket scalper had sold the ticket to her for the regular fare. The road was trying to get a case to scare us scalpers, and the conductor, backed by the passengers, who were indignant at such treatment of a poor deaf and dumb girl, passed her through, but he stipulated that she should give the name of the scalper, which she did willingly, expressing the hope that they would punish him soundly.

Well, I told my side of the story, and when they sent to the address the girl had given them for corroboration of her side they found there was no such street and number in existence. The officers of the road believed that the poor girl shrank from appearing against me and had, therefore, thus concealed her abode. But, not having any evidence against me, they didn't prosecute me, though I remained under a cloud with them.

Not long ago in looking over a newspaper my eyes were attracted to an item headed, "Working the Deaf and Dumb Racket." The item stated that Mary Moyers had been arrested for traveling on railroad trains on worthless tickets and pretending to be deaf and dumb. She represented that the tickets were sold her by ticket scalpers, thus exciting the sympathy necessary to get herself passed and often to draw forth a contribution from the passengers. I sent the clipping to the officers of the railroad she had swindled, and they wrote me a note of apology.

But I don't want any more women in mine.—Field and Farm.

Increase the poultry population.

A SUMMER IDYL.

A boat and a beach and a summer
resort,
A man and a maid and a moon;
Soft and sweet nothings and then at
the real
Psychological moment a spoon.
A whisper, a promise, and summer is
o'er,
And they part in hysteric despair
(But neither returns in the following
June,
For fear that the other is there.)

FARMERS' BOOKS

Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

Cultivator Publishing Company

RECIPES.

Some Warm-Weather Salads.

"One of the prettiest of the luncheon or supper salads is made by cutting the top from a green pepper, removing the seeds with a knife or a stick—they burn the skin if touched with the fingers—and filling the basket thus made with chicken or lobster salad," says Christine Terhune Herrick in the August Woman's Home Comanion. "Each peppor may be placed on a lettuce leaf and crowned with a spoonful of mayonnaise. Another salad is prepared by hollowing a tomato and filling it with dice of cucumber, or peeling a cucumber, cutting it in half lengthwise, scooping out the inside and replacing this with dice of tomatoes. Serve either tomato or cucumber on a lettuce leaf, and garnish with cucumber ribbons. These are made by shaving the peel from the outside of a cucumber and then slicing this. Take a slice—it should be rather thick—and with a sharp knife cut this in a spiral, as you would pare an apple. The shaving must be very thin, as it is not long before the seed center is reached, and only the flesh of the cucumber will serve for the ribbons. Cucumber boats filled with shrimps are a satisfactory dish for a cold supper. Mayonnaise is served with this, or a good boiled dressing. The cucumbers halved and filled with other sliced or dried cucumbers, served on lettuce, garnished with cucumber ribbons and with strips of the scarlet sweet pepper cut very thin, make a good dish."

Canned Corn.

Cut and scrape from cob fourteen cups of nice sweet corn. Add one cup of salt and two cups of boiling water; cook well three-fourths of an hour, stirring often to prevent burning. Put up in glass jars, just as you would fruit, and store in cool, dark place.

When needed for use, turn the corn into an earthen dish and cover well with boiling water, let stand one hour; then turn off the salt water and cover again. Turn off again and season with milk and butter; add one tablespoonful of sugar, let come to a boil and serve.

A Salad.

For walnut and celery salad, shell enough nuts to make two cupfuls of the meats and boil them in salted water with a slice of onion, half a dozen pepper corns and a blade of mace for ten minutes, then turn them into a dish of cold water and remove the skins. Cut crisp celery into small pieces; for the stated amount of meats have three cups of celery. Wipe the nuts with a soft cloth and mix them with the celery and a mayonnaise dressing. Serve each portion upon delicate lettuce leaves. This is a very delicious salad.

HOMELY HINTS.

To prepare the juice of cucumbers which is so often advised for the skin, slice perfectly fresh cucumbers very thin, skins and all, put in a porcelain-lined kettle and cover with a very little water, only enough to prevent burning. Cook slowly till soft and mushy and strain first through a fine sieve and then through a cloth.

In boiling puddings, always place a bit of a stick in the bottom of a saucepan when boiling custard or any sort of a pudding containing milk to keep it from burning. This is why stick cinnamon is excellent for flavoring custard, as it serves a double purpose.

In Making Fruit Cakes.—The tops of fruit tarts should be pricked with a fork before baking, in order to keep a symmetrical shape.

Turpentine is excellent for removing paint stains, but a homely aid is hot vinegar, which will answer the requirement, and is always near at hand.

A good way to obviate the unpleasant effect of certain kinds of ink on pens is to keep several old nails or tacks in the ink bottle.

Add an ounce of gum arabic, dissolved and strained, to a gallon of starch water. This gives a crispness to the curtains quite like the dressing they have when purchased.

Before using tin pot lids rub them all over with fresh lard and heat thoroughly. Any new tin treated in this way will never rust, no matter how much it is put in water, also the steam, when cooking, will not affect the lids.

Do not keep turpentine in a warm room. I am told that turpentine sometimes explodes if kept in a warm place. It is well to be careful, therefore, and put it away in a safe, cool place where it will have no inducement to fly out of its confines.

HAIR TONIC.

Massage the scalp well every day and get it loosened up and flexible so the hair may receive its rightful nourishment by the blood circulating freely at the roots. This will stimulate the growth and arrest the splitting and breaking. This splitting at the ends always indicates poor nourishment, and nothing but massage will relieve the trouble. Apply this tonic as directed: Sulphate of quinine, thirty grains; acetic acid, two grains; resorcin, 120 grains; water, four ounces; oil of eucalyptus, two drams; tincture of cantharides, three drams; alcohol, twelve ounces. Mix, shake until dissolved, and filter. Apply to the roots of the hair every night.

* * *

For treatment for the hair that has been destroyed by the present practice of ratting there is nothing better than scalp massage and the application of a good hair tonic and electrical brushing. This sort of coaxing will produce a new growth and will cause the old one to take new courage to brace up and behave.

AN UNHAPPY COMPARISON.

A country minister had just received his first call to the charge of a small church, and his wife, of course, was highly excited—so much so that she was obliged to tell everybody of the good news.

One day she met a farmer's wife and began the conversation

"Do you know, Mrs. Cross," she said, "my husband has just secured the incumbency of a church, and I can't tell you how delighted I am. I"—

"Yes," replied the sympathetic old lady, "I quite understand your feelings. I felt just that way when our pig took the gold medal at the cattle show."—Pearson's Weekly.

VERY PLAIN.

Two country women, mother and daughter, were at the circus for the first time. They were greatly taken with the menagerie. At last they came to the hippopotamus and stood for several minutes transfixed in silent wonder. Then the mother turned to her daughter and said slowly and solemnly: "My! Ain't—he—plain?"

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Exclusively a Savings Bank whose policy is for ***Conservatism*** and ***Safety,*** the result of ***50 years experience.***
Deposits may be made and withdrawn by mail.

San Francisco Savings Union

Founded June 18, 1862 Northwest Cor. California and Montgomery Sts., San Francisco

Conducts a Savings Bank Business Exclusively

Capital Paid Up, $1,000,000.00. Surplus, $1,183,632.60.
Total Assets, $27,508,850.00.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Aug. 26, 1908.

Butter.

The butter market seems to have lost all interest and the quotations prevailing for several weeks still stand almost unchanged. Actual selling price of extra is 57½c. Lower grades show a rather weak tone.

Wholesale quotations now are:

Creamery ex per roll	55
Firsts	52½
Dairy	25
Cooking	22
"Butterine"	15@20

Cheese.

Cheese is still weak though an effort is made to strengthen it by holders of large stock.

Southern California	14½@17
Northern fresh	14
Longhorn	17@18
Eastern singles	16½
Cheddars	17
Imported Swiss	28@28¼
Swiss	17½
Oregon	15
Limburger	18

Eggs and Poultry.

Eggs are showing little interest at present and quotations are exactly as last week.

Eggs local candled	35
Eggs case count	30
Firsts fresh	33
Eastern fresh	25@26
Eastern fresh jobbing price	23@26
Storage	26

Poultry is showing more interest and a slight advance in quotations is observed.

Wholesale prices..

Hens per lb	12@13
Young roosters per lb	17
Fryers	15@17
Broilers per lb	15@17
Roasters	18
Old Roosters	7
Turkeys	16@20
Geese	10@11
Ducks	11@12
Squabs	1.25@1.50

Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 pounds	6
Prime steers	4¼
Heifers	3½@3¾
Calves per lb	4½
Sheep ewes per head	3.75@4.00
Lambs per head	3.00@3.25
Wethers	4.00@4.50

Potatoes.

The potato market seems to be in the hands of one or two who are forcing the price down to an unreasonable figure. There is no call for potatoes to sell as low as they have been for the past few weeks and some claim the wise potato man will hold for a short time at least. Some Highland fancys were thrown on the market last week at $1.10 in an apparent endeavor to break the market.

Wholesale prices are:

Sweet potatoes per lb	2½
New potatoes per ctl	1.30
New potatoes choice	25@75
Northern Burbanks fy	1.25
Highland fancy	1.30

Onions.

Wholesale quotations are:

Bermudas per 100	1.00@1.10
Silverskin new	1.00@1.15
Crystal wax per crate	1.00@1.20
Northern Red	90@1.00
Australian Browns	1.00@1.10
Danvers	1.00@1.15
Garlic	9@10

Vegetables.

The following are commission house prices; deduct freight and commission to secure farm prices.

Asparagus per doz	9

Hay.

During the past week hay arrivals have decreased a bit, the total receipts being 3180 ton compared with 3890 the preceding week. As a result the market here is a little stronger. The light arivals are caused by nothing else but a car shortage and this car shortage is felt to quite a severe extent in many of the larger hay districts. The hay is in the fields and the raisers as well as the purchasers are anxious to have their hay market and thereby be out of danger from any possible early rains. There is no doubt but that if hay could be brought here as it was ordered, the market would be considerably weaker for under present trade conditions, heavy arrivals would not be absorbed here except at lower prices, which consumers are anxiously looking for.

The situation regarding alfalfa hay is somewhat stronger especially throughout the country for many raisers claim that their fourth and fifth crops will be very light owing to the present lack of moisture on the one hand and on the other hte possibility of early rains which would prevent the later crops from being harvested. The dairymen are beginning to realize this fact and are, therefore, beginning to seek their yearly stock of this feed, the consumption of which is becoming greater every year.

FARMERS' GAIN FROM PROTECTING BIRDS.

The brief survey of the subject possible here only imperfectly sets forth the nature and importance of the service of birds to agriculture. Nevertheless, it must appear that to the question "Does it pay the farmer to protect birds?" only one answer is possible. Even from the point of view of an investment for profit the time and expense necessary for their care and protection are richly repaid. There is the added consideration that without the music and companionship of birds the world would be the poorer. Anything that adds to the attractiveness of the farm and increases the interest of farm life is worthy of cultivation, even if no actual return is received in dollars and cents. Happily the farmer who protects birds secures a double return—increased profit from his crops and increased pleasure of living.—Yearbook of the Department of Agriculture, 1907.

A SHOWING OF FINE HORSES.

After the state fair last fall the Cultivator remarked on the fine showing made by the La Fayette Stock farm. We are now in receipt of a letter from the management of the California branch that there will be another large exhibit at this state fair. Mr. Campbell, the Sacramento manager, has just received 150 Percheron, Belgian and German coach stallions and mares. Many of these are already prize winners from Europe. Mr. Campbell says they are "Decidedly the highest class of horses we have owned." The horse lover will find in this one exhibit sufficient to pay for a visit to the coming fair. This branch of the La Fayette farm is now in Sacramento permanently.

Kern county is making an effort to hold a fair this fall.

Bees and Their Care

THE PLACE OF BEES ON THE FARM.

The last decade or more has been notable for the great advances made in all departments of human life. In this general and insistent advance, in the broadening of ideals and in the increase of knowledge and its effective application, the farmer stands in the very front ranks and the most effective agencies in this advance have been Farmers' Institutes and our very numerous and ably edited and conducted farm journals. As a result of this advance, industries, which formerly were insignificant, have in some cases developed into gigantic proportions as for instance in the case of the egg and poultry business. There is one source of income, whose home is on the farm and whose possibilities are undreamed of, which as yet has received but scant or no attention at the hands of either our institute workers or our farm papers who have very little more conception of the possibilities of bee culture than our forefathers had in the days of the box hive and the straw skip when the swarming season was marked by the ringing of tin pans and tooting of horns and when most of the crop of honey was secured by brimstoning the bees and then crushing the comb and allowing the honey to drain off. The honey thus secured was mixed with pollen and other impurities and would not today be allowed on the market. The crop was then necessarily small and the results always uncertain. Dating, however, from the introduction of the movable frame hive greater progress has been made in bee culture than in any other department of animal industry until today the bee is more responsive to intelligent hadling than any other creature.

Trebled the Yield.

Our continually extending knowledge of the work has also greatly increased our returns until today we have almost trebled the yield of honey per hive and it has been as greatly improved in quality as it has been increased in quantity. There is today no food purer or more healthful or delicious than a nice quality of extracted honey.

A number of large bee keepers have from time to time advocated the passage of a national law which would deprive the farmer of the right to keep bees and limit this privilege to specialists. I am a specialist in bee culture but I have been and always shall be opposed to the passage of such a law. There is no probability ,however, that such a law will ever be enacted. Great as the industry has become yet there are probably two colonies of bees kept by farmers to every one kept by specialists, and the amount on the farm should be increased many times over.

Two Hours a Week.

Wherever conditions are favorable for bees they should take their place as part of the farm stock. Farming is a busy life but two hours a week during the summer months will cover all the work necessary to care for 12 or 15 colonies of bees and they will net in a good year from $100 to $120 and from thirty to fifty dollars during a poor year and if you figure up the returns you thus receive for your time you will find there will be nothing else to compare with bees in return for investment and labor.

Otherwise a Waste.

While bees are thus gathering the honey which would otherwise go to waste on the farm they are also greatly increasing the yield of everything which they visit more especially if it be an orchard or a clover field, where the yield of fruit or seed, as the case may be is very greatly increased by their visits.

Before investing in bees, however, it is very necessary to get rid of the idea that you can succeed with them without preparation. There is little success in the world worth having unless we are willing to pay the price. Get a good work on Bee Culture and familiarize yourself with the most up-to-date and successful handling of bees. Make yourself familiar with all the processes of the hive then get a couple of colonies of bees and as you study the subject you will familiarize yourself with the work and you will soon acquire the requisite knowledge and skill for handling bees and making them pay.

Fascinating.

As the work of beekeeping is as fascinating as it is profitable a great many farmers cannot resist the temptation of running the number of their colonies up to forty or fifty swarms. As the swarming as well as every other operation connected with the colony is under the beekeper's control and is attended to at his convenience, bees can be so increased and cared for without any interference with the regular work of the farm that that number of bees will frequently net in returns as much clear profit as will forty acres of land under ordinary cultivation in a fair season.

The greatly increased production of honey by farmers might lower its price somewhat but not as much as many beekepers fear. This is one of the arguments against any great extension of beekeeping outside of specialists, but it is largely a false alarm. The consumption of honey is increasing at much greater strides than its production and it will continue to increase. If the day should ever come when the use of honey should supplant the use of all the commercial syrups today in the market it would mean an untold blessing to the country and a great saving in doctor's bills.—North Dakota Farmer.

BEES AND HORTICULTURE.

Their relationship is interdependent; the bees want and will have the nectar. The bloom of fruits and flowers needs to be pollenized; thus both interests are mutual. Bees never visit trees only when in bloom and it is then they obtain the nectar and pollen, at which time they distribute the pollen from one blossom to another, thus causing cross-fertilization, making them the greatest boon to the horticulturists, florists and seedsmen. But, says, one, the law says I must spray for moth and other insect pests. True, but the law also says you shall not spray while your trees are in bloom, to the destruction of your neighbor's bees; and the man that will do this, thus depriving himself of as bounteous a crop of fruit as he otherwise would have, may be classed with the robber farmer who sells his lucerne hay for less than the actual cost of the component fertilizing contents. A hint to the wise should be sufficient.—Deseret Farmer.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Revise Our Horticultural Laws

Chas. A. Chambers of Fresno, Speaking at the Pacific Coast Nurserymen's Convention, Gives Suggestions as to Needed Changes

SOMETHING must be done by the nurserymen of the Pacific Coast to obtain a uniform set of laws under the direct supervision of the State quarantine officers in the respective States governing the proper inspection of nursery stock. Various counties throughout the West have enacted laws of their own, which, to say the least, in many instances are laughable in the extreme.

These county laws very often conflict with the general State laws and according to the attorney-general's rulings the county ordinances are very often unconstitutional. This is especially the case when the county horticultural commissioners or inspectors condemn shipments of nursery stock, simply on general principles and for no other plausible reason.

I contend and always will contend that where a shipment of nursery stock is free from disease or insect pests of any character, the shipment should be allowed to be received and delivered to consignee, no matter from what point it was shipped, providing, of course, it is duly and properly inspected before shipment and a clean bill of health is issued by the horticultural inspector at shipping point.

A nurseryman in good standing uses every care and precaution in the first place to see that his cuttings and scions are taken from good, healthy, growing varieties, for it is as easy to propagate nursery stock from healthy parent stock as otherwise. When due care is exercised and every precaution is taken to this end, there is very little danger of delivering to planters stock other than that which is in every way healthy, thrifty and first class.

I am quite sure the average nurseryman regards his reputation above everything else and makes it a point to cary out this policy in the preparation of his stock, and where this can be verified and confirmed by the inspector at the point of shipment, I see no reason why any nursery stock should be condemned if a few gnats or ants are seen on the shipment when it is unpacked.

Speaking from experience I have made to certain localities shipments which have been turned down by the receiving inspector, because the trees in the car happened to be a little heated and shriveled at the tip ends. The "wise" inspector made the statement that the stock was affected with blight which he called by some long, compound, cathartic name, when in reality there was nothing wrong with the trees except as noted above. This heating is bound to happen to trees at times, especially when there is delay in transit or the packing material in some manner creates heat. What the inspector should advise in a case of this character, is to instruct the reeciver to unload stock, heel same in the ground and water well, when this condition in nine times out of ten will be remedied.

We have at various times had to call on the State quarantine officer to act as referee in cases of this kind. We could not convince some "wooden-headed" county inspector that the stock was not blighted but simply heated, and in every instance the State officer made Mr. 'Woodenhead' stop, and put him wise on what the important inspector does not seem to comprehend. This goes to show that the average county inspector does not know what a diseased condition really is, and as a consequence, nurserymen not only have stock returned at their expense, but it is heralded in the local press that a shipment of nursery stock from so and so has been condemned.

This sort of advertising gives an innocent nurseryman a bad name. It is, therefore, time that we should come together and have our quarantine laws regulated. I will cite an instance showing how little some inspectors know when stock is really diseased. Last year we made a shipment of peach trees to a northern county. The tip ends of these trees were a little shriveled caused by heating. The shipment was rejected by the receiving inspector, although the shipment when it left Fresno was duly inspected by the local commissioner and a clean bill of health given. What was the result?

The shipment was returned after we had spent several dollars telephoning consignee assuring him that the stock was free from disease of any character. We also telephoned the inspector and had our local inspector do likewise, but we could not, to save us, convince him that the trees were in prime order. The inspector went so far as to send a few tops of the trees to some supposed-to-be entomologist, and to our great amazement the entomologist gave it as his opinion, although he was not absolutely sure of it, that the trees were blighted. So far so good. Now here comes the funny side.

We received these very same trees back from consignee, heeled them in our tree yard, watered them well and in a few days this heated condition was overcome and the trees were as bright and clean looking as they were when standing in the nursery row. What became of these trees? This is funnier still. It seems the person who ordered the trees in the first place from us, placed a duplicate order with another nurseryman, inasmuch as our poor, blighted (?) trees could not pass inspection. This nurseryman did not have the stock and bought some of us. We filled his order with the very same trees and the nurseryman in turn shipped to our customer, who had previously rejected the stock, and I'll be hanged if they did not pass inspection at the other end of the line without one whimper. In your fancy can you conceive anything more comical. I can cite several instances of pretty much the same nature, but as this happens to be the best, I am relating it, simply to show what peculiar people we have to deal with in this world.

I am of the opinion that all inspectors that try to be important and who know absolutely nothing as to whether stock is healthy or diseased, but act simply on the general principle plan, should be fumigated and have their whiskers, if they possess a set, sprayed with lime, sulphur and salt, to impress them that they need a little purifying themselves. I move that the State quarantine guardian, when he runs across one of these important inspectors having no knowledge of existing conditions, do the spraying and in addition have him removed from office for incompetency and substitute some one with average intelligence. I am aware of the fact that all counties do not possess an entomologist, but they do possess fair-minded people qualified to carry on the office in a straightforward way, and when they do not know positively whether nursery stock is infested, they will take the trouble to learn from some one that does know, instead of taking it upon themselves to reject a shipment, just because a root looks a little crooked or there is a small dab of rust on the bark.

I again repeat, what we need is a uniform State law to regulate all shipments of nursery stock, setting forth what the nurserymen must comply with when making shipments and receiving them. These instructions should be given by the State quarantine officer and the various county inspectors should be made to enforce these regulations and no other. If stock has to be fumigated let the State officer say so, and I am sure that the nurserymen will comply with any halfway sensible law in each and every instance. The way the matter stands, nearly every county has a different condition for the nurseryman to comply with and it is next to impossible to satisfy the whims and notions of many of the county ordinances covering shipments of nursery stock. If nursery stock is affected in any way, it should be condemned and the law is all right when it is carried out fairly, but to simply condemn nursery stock without any apparent reason, just because a shipment when it reaches destination happens to arrive when the inspector's liver and kidneys are out of order and he takes his grievance out on the nursery stock, should be remedied.

We have in California, in Edward M. Ehrhorn, the State quarantine guardian and entomologist, a very practical and well posted man, and all his rulings when any question has arisen, have been fair to all parties concerned. At any rate we are always ready to leave matters in dispute to Mr. Ehrhorn, with every assurance that we will get a square deal. His judgment in all matters that confront him is good and sound.

From now on the nurserymen of this coast should use their best endeavor to have a uniform set of inspection laws passed, governed by the State officers and have them in turn instruct the county commissioners how to carry them out and thus do away with special farcial laws enforced by county ordinances. This is the only remedy: I am also in favor of making it compulsory for every one applying for the position of horticultural inspector, to take an examination held by the State quarantine officer, to ascertain whether the applicant possesses enough good, hard, common sense to carry on this office in a business-like manner and is otherwise fitted to give all matters that demand his attention in this particular position careful consideration.

The system of giving this office to some pet of the administration simply to repay a political debt should be done away with. All the nurserymen request is, that some one is appointed who has good judgment, a practical and broad man free from prejudices and petty methods. When such a man is appointed he should be kept in office regardless of his political affiliations. When this is done the nurserymen will receive a fair and square deal.

In conclusion, I do not wish to infer in this article that all horticultural inspectors and commissioners are not of the right calibre to carry this office. For we have in this State, as well as in the Western States generally at this time, men qualified to fill this office, competent in every way and who are always ready to give a nurseryman a square deal and nothing more, and it would be very gratifying indeed if the various counties would always appoint men with good sound judgment to fill the position of horticultural commissioner.

With the Citrus Growers

THE PROPER TIME TO USE STABLE MANURE.

THE best time to apply stable manure is, perhaps, when it can be had. There may be a particular time when the results are best, but when two to three cents a foot must be paid, it is economy to get it into the soil or in the orchard and dried out as soon as possible. Every odor that can be detected from a load of manure indicates that nitrogen in some form or other is passing off. If the manure is left in a pile it continues to send off odors for a considerable time. When scattered and dried the odors cease, and if worked into the soil with a disk cultivator there is very little loss.

It is well known that when stable manure is applied to growing grain, the stimulating effect is almost immediate. If it is applied to citrus trees out of their growing season, it will lie there till the growing season arrives and no doubt some of its valuable elements are lost, some nitrogen and soluble potash. but the amount is small in any case and only when an undue amount of water is applied is there leaching that takes them beyond the reach of the roots.

It is known that nitrogen produces rapid growth and if given in excess produces sappy tissue. It is a pretty well settled fact that if an excess of nitrogen is applied before the fruit is matured it tends to make the texture of the fruit soft. This is one reason why some growers are cautious about the time of application of stable manure, but the material is so scarce and expensive in California that there are at this time few groves indeed where this condition exists. When a grove is in need of humus and nitrogen, stable manure must be heavily applied for a number of years before any deleterious effect is noticeable in the fruit. With the exception of where the fruit shows a tendency to grow soft through an excess of nitrogenous materlal, we would not hesitate to put on stable manure whenever we could get it. Its action as a mulch begins as soon as it is applied. Its mineral ingredients cannot get away in the atmosphere and its nitrogen cannot get away through the same channel unless fermentation takes place. Fermentation stops as soon as it is spread out to dry, while if the manure is placed in piles and constant care is not given it, fermentation sets in and great loss is entailed in a few weeks. If the manure is left in piles till the theoretical time arrives for it to be spread in the grove, there is no doubt but that much of its nitrogen is lost.

Will citrus trees be forced into new growth out of season by the application of a nitrogenous fertilizer? The general opinion is that they will. The fact of the case is, all live plants are constantly absorbing soil fluids, if you may call them such, the soil waters with their soluble contents. Were this not the case, they would die as is demonstrated when a branch is cut off. It is removed from the circulating system aud cannot get its supply of sap.

There are certain natural and well defined periods of growth when the plant takes on new growth. With deciduous trees, this period extends from the beginning of spring till various periods during the summer months provided the climatic conditions are proper. The duration of these periods also depends on the age of the plants.

With citrus trees, there are three well defined periods of growth during the time between February and October. There are always spasdomic growths of isolated branches, but we refer to the vigorous growth that extends all over the tree and makes its chief increase in size.

We are sure that nitrogenous fertilizers will not force a general growth out of season, if climatic conditions are favorable to a normal growth. or the trees are in a normal condition. They will, however, be fed and stimulated by the fertilizer at the time of normal growth. These points have been pretty well demonstrated.

Such being the case, stable manure may be safely applied right after the fall growth of citrus trees is made or any time during the spring or summer when its chief effect will not come on the fall growth, in the case of groves situated where frost is liable to do damage. Where there is no danger from frost there will be no danger of ill effects from stable manure applied at any time, except it be in the case of fruit that is liable to be soft.

SMALL GROWERS SHOULD WAKE UP.

The highest prices on navels this season have been realized by the National Orange Company, L. V. W. Brown and C. E. Rumsey of Riverside, says the Press of that city. Their success is admittedly due to the high grade of their pack and that has been in large measure determined by the careful attention they have given in the grove and in the packing-house to the suggestions of G. Harold Powell of the Department of Agriculture, who has been investigating the marketing problem in this State for several years. The Chases, who control the National Orange Company, and Messrs. Brown and Rumsey are all owners of large acreage; and it is a significant fact that no small grower has done as well as they have. The reason why is undoubtedly that their fruit has been more carefully handled, more attractively packed, has been uniform in grade, and has reached the eastern markets in better condition.

The Arlington Heights Fruit Company, that handles the fruit from the groves of the Riverside Trust Company, is another concern that has applied the improvements suggested by Mr. Powell and has realized fine prices as a result of better methods of production and packing. C. C. Chapman of Fullerton is another large producer who has made a fine showing, especially on Valencias; and he has always been prompt to make use of the results of scientific study of the orange question.

Are we to infer from this that only the big grower and shipper can take advantage of the best information available as to scientific methods of producing and packing fruit? We should be reluctant to admit that; but it is evident that the small grower needs to be waking up.

Some of the associations connected with the Exchange have been making a showing on their fruit that compares favorably with the returns of the few leaders we have named; but the managers of the associations have found it difficult to arouse the small growers to the importance of improved methods to such an extent as to secure the co-operation necessary to complete success.

the future of the orange industry in Southern California is in large holdings that will make possible the application on a large scale of the most modern and scientific methods of culture and packing; but that would not be a good thing for the country. A good living can be made from a ten-acre grove; and what we want is more individual growers living on ten and twenty-acre lots rather than big properties operated by wealthy capitalists or big companies and perhaps hiring Japanese labor for a considerable part of their work.

The individual grower is really in position to give a degree of detailed attention to his grove that cannot be given by the owner of a big tract. He does considerable of the work himself and supervises the rest in person. He ought to have the most up-to-date system in the care of the grove and the handling of his fruit. And if he markets through an exchange association he ought to stand for the increased expense necessary for a scientific handling of the fruit in the packing-house.

It is rather discouraging to note the indifference of the small grower to Mr. Powell's work and his slowness to understand that a proper application of the truths he has developed may mean 50 cents or even a dollar a box more for his fruit. He ought to study the market returns and ask himself why it is that his fruit is selling for only $2 or $2.50 a box when the Chases, Brown, Rumsey and others are getting $3 and even $3.50 and $3.75. The wide range of prices is not due to any difference in soil or climate or other natural conditions. It is due to the fact that the people produce a better grade of fruit and pack it in such a manner that it reaches the market in better condition. What they have done, others can do and more than that, should do.

The small grower ought to get busy and put himself in line for better profits and help the development of the orange industry along the lines that will prevent the calamity of its falling into the hands of a few big producers.—Redlands Review.

MORE REASONABLE.

The recent article in the Cultivator in which comment was made on the statement of a San Antonio paper that Texas would soon put California out of commission in citrus production and stating that "Mr. F. G. Hutchison came from Santa Clara in Joaquin Valley" to take up the cul ture of oranges calls for the following from Mr. Hutchins, which we are glad to give place in the Cultivator:

In the issue of your paper under date of July 30th notice an article "Oranges in Texas" taken from a San Antonio paper. As there are misleading statements in it as well as in a Galveston paper of recent date—wish to give you a correct statement of the facts as they really are.

In the first place I am from Ventura county instead of the San Joaquin valley; secondly, I have never been a member of the California Citrus Association; neither was I sent out by it to investigate conditions in Texas for the growing of citrus fruits. I did not sacrifice my property in California, realizing $1000 per acre for part of it. My change from California to Texas was a purely business venture. Finding climatic conditions favorable for the growing of citrus fruits, purchased fifty acres of land and am now planting to oranges and engaging in the citrus nursery business. Apart from giving me prominence, I do not relish these stories, more especially as I have no knowledge of ever having been interviewed by a reporter of either paper. The statements contained in the interviews are correct, insofar as they relate to the adaptability of this climate and soil for the successful growing of citrus fruits referred to.—F. G. Hutchinson.

The statement in the Galveston paper is as follows:

Sold His California Orchard.

"Two years ago the California Citrus Association hearing of the southwest Texas fruit belt, and fearing competition much nearer the great markets than their orchards were, sent F. G. Hutchinson, one of their members and a large grower, to investigate. Mr. Hutchinson went to Beeville. There he found a climate and a soil even better adapted to citrus fruits than California. He stayed and investigated thoroughly, then made a written report of his findings, sold his California orchards at a sacrifice and became a resident of Bee county. Mr. Hutchinson immediately purchased 100 acres of Bee county land, and now has 25,000 growing trees. He did not confine himself to Satsumas and Dugats, but has budded various kinds of California and Florida oranges to hardy Texas varieties. With a lifetime spent in growing oranges, Mr. Hutchinson states that he was never more convinced of success than he is now. He is more than satisfied with his investment."

Mr. Hutchinson should call off the fool papers of his adopted state or induce them to get a little closer to common sense.

AN EYE ON THE FUTURE.

Tommy's maiden aunt had called attention to some of that young man's misdemeanors, thereby causing him to be punished. Tommy pondered a while, then asked, "Papa, will little sister Gladys be an aunt to my children when I am a man?"

"Yes, Tommy," answered his father, much interested. "Why do you ask?"

"'Cause she might as well get married and have a home of her own, for I don't intend to 'low any aunts to stay around my house, making trouble for my children."—Woman's Home Companion for August.

Market for Valencias has been exceedingly good this season. There are probably less than 500 cars yet to ship.

Redlands orange growers will receive about $2,300,000 for their crop this season.

FARM TOOLS

No tools are so well adapted to their various uses as Keen Kutter Tools. Every stroke made with a Keen Kutter counts—that is why there are so many in the hands of farmers. No time lost from breaking—little from sharpening.

KEEN KUTTER
Quality Tools

accomplish the most—in the quickest way—at the least cost. Keen Kutter Tools are all guaranteed and all identified by the Keen Kutter Trademark.

The name Keen Kutter also includes carpenters' tools of all kinds, such as: Saws, Chisels, Bits, Drills, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Screw-drivers, Files and Pliers. Also a full line of Scissors and Shears, Pocket-knives, Razors, Table Cutlery, etc.

Sold for nearly 40 years under this motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Peckham Says—

Increase Your Income
$2,000 a Year

I want every man or woman who is reading my ads. to keep in mind that buying 20 or 40 acres of our Corcoran land is an investment, not a speculation—yet you get returns equal to those from successful speculation—and all the while you are secured against loss by the finest farm land in the world.

There is no question like finding "gold," or striking "oil" about our Corcoran proposition. The LAND is there for all time; the water is there for all time to nourish and fertilize it; you don't have to dig the ground deeper than to plant the seed—there is no chance known to man for a single crop failure—and you can easily make $2000 a year.

George C. Peckham & Company

Since the rearing of the young orchard to a productive state is expensive the work is worth doing well. The paying orchard is the one that is planted right and cared for through the years until in good bearing.

El Monte walnut growers have decided to use the salt solution process of bleaching walnuts.

Deciduous Fruit Culture

PICKING, GRADING AND PACKING APPLES.

As we never pack without first grading, and never grade without first picking, I have taken for my subject, "Picking, Grading and Packing Apples." I will treat it under those subdivisions, and shall tell you as briefly as possible just how we have handled our own apples for the last six years.

Picking.

Our varieties being red, we depend on the color to tell us when ready to pick. As this is the most critical time in the life history of the apple, the greatest care must be exercised to obtain the best results. We must handle the apples as carefully as eggs, and use every means to avoid bruising or breaking the skin; for in nearly every instance decay in a box of apples starts in a damaged specimen and spreads to the other apples in the box. Right here is the basis of a reputation.

In picking the apples should be grasped by the full hand, not by the fingers; then by a slight upward, or downward turn of the wrist, the apple will be removed from the fruit spur without pulling out its stem or injuring the spur. I should like to say right here that it is only a question of a short time when apples that have lost their stems will be denied admission to a first-class pack, as the pulling out of the stem always results in abrasion of the skin in the cavity and injures the keeping quality of the apple.

Now, having fully explained to the pickers as to how I wish the work done, I go with them to the orchard and start them to work. Each picker is furnished a 14-quart galvanized iron pail, with a heavy wire hoop firmly attached to the bail, and a supply of apple boxes is placed within easy reach. I send one man on ahead to pick up all "grounders," and place them in marked boxes, so that the haulers may keep them separate from the picked apples. The next division consists of three men, who pick directly into boxes, and as my trees are low headed, they get about one-half the crop. They are followed by two men provided with low platforms, or trestles, on which to stand. These men, picking into pails, get about half the remaining apples and are followed by two ladder men with a helper, whose work is to take down, empty and hang up pails. In removing the apples from the pails to the boxes, no pouring is permitted. They must be handled as a grocer would handle eggs. I select a reliable man from the crew and make him foreman and timekeeper, and, paying him an advance over the others, hold him responsible for the work of the crew.

Grading.

As fast as picked, our apples are hauled to a packing shed, where four men are put to work grading. For this work we have a table 4 by 10 feet, two men working on each side. Each man takes a box of apples as they come from the orchard, and, placing it on the table, arranges empty boxes at his right and left hand. Each apple is carefully inspected and graded as to size and perfection. All absolutely perfect apples are separated into two boxes, the four tier and the larger going into one box and the four and a half and five-tier into another. All apples suitable for a second grade and size from four and a half tier up, go into a third box, and everything else into a fourth, or cull box. Our number two grade consists of good, sound apples, but may be ill-shaped, off color, limb chafed, have worm sting in skin but no worm holes. This grade is sold to western buyers.

As a guide for graders, we set up before them one apple each of four, four and a half, and five tier sizes, and we find it only requires about half a day's work to qualify a man so he can do good work without referring to samples. We furnish our graders (also our pickers) with soft canvas gloves; and in handling an apple it is so twirled in the hand that most of the marks of late spraying are removed. We do not aim to polish, but simply to remove dust and spray marks.

As fast as graded, the apples of one size and grade are stacked separately, five boxes high, being careful not to bruise apples by having boxes too full. We allow our pickers and graders to obtain one or two days' work ahead before starting packers; as all our apples are wrapped in paper when packed, and they are less liable to sweat if thoroughly cooled before they are so wrapped. Understand, we have a good roomy, well-ventilated shed in which this work is done and where they are stored until ready to haul to station.

Packing.

Having our apples graded as stated above, and with all culls removed, the work of packing is very much simplified. We have two packing tables. These are frames of 2 by 4 scantling, and are 3 by 11 feet in size, covered by 20-ounce duck, and are arranged for four packers at each table. As these tables must support considerable weight they need to be strongly built. Use bolts, not spikes, in their construction. To protect the apples, run a rim of half-round moulding, or old spray hose around the edge of the table. We use two good strong trestles on which to support the table. We also provide a lining table, where the packers line their own boxes. This is placed convenient to the packing table. We furnish each packer with an initial stamp, and they are required to place this stamp in the upper right-hand corner of the stenciled end of each box packed. They are also required to note with pencil on the edge of the stenciled end the actual count of apples contained in the box. This is for the information of the nailer, at whose table is kept a full supply of stamps for numbering and designating grade and variety, and it is a part of his work to apply these stamps, in which he may be assisted by the table tender.

Now, the size of a packing crew must depend on the number of packers you intend to work. We have from two to twelve, turning out from 70 to 400 boxes a day. In any event, we must have a good man for foreman, one who fully understands the various packs and is competent to direct and instruct the packers. He must also be in sympathy with your efforts to put up first-class stock in a first-class manner. The foreman and packers must be constantly on the alert to remove any defective apple that may have passed the graders and reached the packing table. Having a foreman and two to four packers, we need another man to remove the boxes as packed, from the packing table. He will also stamp, nail up, pile away and assist the foreman in feeding the packing table from the graded apples. Should we be working six to eight packers, we need still another man. Our crew would then consist of a foreman, one table tender, one nailer, and eight packers. This sized crew has given us the best results, as it balances with our picking, hauling and grading crews and keeps everybody busy. Now as to the packers. We prefer ladies, for, as a rule, we find them more painstaking, more willing to follow instructions, and they show a greater pride in their work than men. I have never had to go out of our own neighborhood to obtain packers, and our apples last year were packed by ladies who have packed for me two, three and five consecutive years. Of course, we give them every convenience with which to work, and they are not allowed to lift anything heavier than an empty apple box.

The different styles of packs are known to the trade as three, three and one-half, four, four and one-half and five-tier packs. They are also designated as straight and diagonal. The straight pack includes the three, four and five tiers. This makes the neatest pack of all. It is also the hardest to pack without injury to the apples, as each apple rests firmly against the other; and there is a tendency to bruise when the pressure of the nailing press is brought to bear. To avoid such injury, care must be used in the straight packs not to allow the apples to extend more than one-quarter of an inch above the box at the ends; and the bulge in center must not exceed one inch, including both top and bottom.

In the straight packs, the box is first lined with paper, this paper being pleated six inches from the lower end with a quarter-inch pleat. This prevents tearing the lining when the bottom is bulged. A cardboard, full size of the box, is also placed in the bottom. Each apple is wrapped in duplex paper, being careful to have the finishing fold of the wrap come over the stem, to prevent injury to its neighbor. A cardboard is also placed betweeen each layer and on top. In these packs, or in the diagonal packs, the apples may be placed either on their sides or on their stems or on their calyx ends, as may be found necessary to build the proper bulge. We prefer to face the bottom and top with apples on their sides, and, if necessary to face this way down one or more layers, let that be done in the center of the box. We believe a box faced in this manner presents a neater appearance when opened up than if faced with either stem or calyx out.

For fear some one may not understand the terms three, four and five tier, I would say three tier means three apples wide and three apples deep and the rows running parallel with the edge of the box, perhaps five or six apples long in standard box, according to variety. A box so packed should contain 45 or 54 apples. Four tier means four apples wide and four apples deep, and maybe six or seven apples long, and contains 96 or 112 apples, and where in certain varieties, it is necessary to turn down one or two layers it may contain 104 or 108. Five tier means five apples wide and five apples deep, and is usually packed eight apples long and contains 200 apples. The diagonal, or

nested packed, is so called because its rows run diagonal with the side of the box, and the apples so packed, instead of resting on each other as in the straight pack, tend to find the spaces. This is one advantage. Another is that it can be used for apples of such sizes as will not adapt themselves to the straight packs. Three and a half and four and a half tier apples go into this pack. All cardboard between layers is omitted. A three and a half tier is a size too small to pack three straight and too large to pack four tier and gives us a diagonal pack, a box containing 64, 72, 80 or 88 apples. In the same way the four and a half tier apple is too large for five and gives us in the diagonal the numbers 150, 165 and 175. This style pack is rapidly coming into favor. It suits the growers as it requires fewer apples. It pleases the buyer, as the apples carry better and bruise less than in the straight packs.

Realizing that this paper is already too long, I shall not attempt at this time to describe how these packs are built up, but would say we believe in thoroughness and perfect work, and use every means known to us to put our apples up in the best possible manner. We use only bright, clean, perfectly made boxes, one end of which carries our stencil, with the number of apples, grade and variety neatly stamped thereon. We believe in advertising. Inside of each box, on top of the apples, we place a neatly designed mat, carrying a photograph of a scene in our orchard, together with our challenge and guarantee. This card will be displayed by retailer to advertise the fact that his apples are guaranteed, and it results in a demand for more of the same brand.

Some one asks: Does all this pay? In reply, let me say that for five years I have sold my fancy apples to the same New York firm, and last August they sent their man to me with instructions to say to me: Apples are going to be high; it's too early to make a price. When ready to sell, make your own price; we will take your apples. It is enough to say they got my apples at my price, and paid for them without inspection.

BUDDING WALNUT TREES.

The budding of nursery stock walnut trees has been practised with varying degrees of success for several years, and some work has been done on old trees with the view of changing them to better and more productive varieties. The greater part of the nursery budding has been done in the southern part of the state and almost all of the top budding in the counties bordering on the San Francisco bay.

Mr. Pennington of Vacaville has been very successful in budding by cutting buds in the regular shield form about 1¼ inches long, cut from branches ½ to ¾ inches in diameter so as to get wide buds with but little wood left in them. He also prefers to have stocks large and considers a stock 1½ inches diameter not too large. He uses ordinary budding twine for tying but does not use wax to cover the incisions. Says it is best to put off the budding as late as it is possible to get a good flow of sap, as then the weather is likely to be cooler, which is an important factor, and the growing season is about finished, which will allow the twine to be left in place all winter, which he considers advisable.

When doing the work Mr. Pennington prepares the incision to receive the bud, then cuts the bud and puts it in place, tying at once. No special preparation of the budding wood is made except that mature buds are taken. About 90 per cent of the buds placed are said to grow.

Old trees can be prepared for budding by cutting back during the preceding winter so as to induce the growth of young wood, or if grafting has been done and part has failed, the buds can be placed in the shoots.

The shield buds are also used by Mr. Keith of Selma, who has made further experiments in preparing the buds before they are cut from the wood. This is done by cutting the leaf stem off at about two or three inches from the wood two or three weeks before the bud is needed. This leaf pruning is supposed to ripen the stem and cause it to fall, leaving the bud smooth and easily tied. It also serves the double purpose of preventing evaporation through the leaf stem, which is very severe on a newly placed bud if the weather should be hot with dry winds. The bud is cut 1½ inches long, the longer half of the bark being above the bud. The wood is either cut deep, or the bark is cut so as to form an oval of considerable width and peeled from the wood, in this way differing from the ordinary shield bud which has some wood left under the bud. The buds are forced well down under the bark of the stock, tied with soft twine and all the cuts waxed with soft wax well pressed in. Care is taken that the bud is clear. The branches are cut above the buds the following February and waxed over. A shade was placed over the buds at Selma but this is not necessary unless there should be excessively hot weather.

Successful budding has been done by using plate buds, or ring buds, where the cutting was done by a specially made knife, made by taking two knife blades with a block of wood between and riveting the whole securely. In this way the bud will exactly fit where the bark was taken from the stock.

The success of budding depends on having the stock and bud both in vigorous growth and in keeping them in that condition until the proper union has been made. Weather conditions also affect the setting of the buds, since a much larger percentage will grow if the next succeeding days are cool. The twine used should be soft cotton and as large as 12-thread budding twine. The tying should be firm enough to exclude all air from between the bud and stock, but not tight enough to crush the bud.—J. B. Neff, Anaheim, Cal.

RESISTANT GRAPE ROOTS.

From what we have seen lately, the indications are that much benefit is being derived from the introduction of certain resistant vines, independent of the presence of phyloxera. The Rupestris St. George shows a strong, vigorous growth in certain dry situations where even the Tokay is suffering from the drowth. In many instances where St. George has been planted to fill in vacancies where vines have died, this variety keeps on growing while the surrounding and older vines have ceased growing.

In regard to guarding against phyloxera, it is not good policy to plant commercial varieties of grape vines on their own roots, even though the insect is not present in the locality, as there is no telling how soon it will make its appearance. There may be an exception to this in the Imperial Valley, where water is cheap and its application is simple and cheap. In that district there is no need of going to extra expense to secure a vigorous growth, as it comes with the simple application of water, and phyloxera is killed by continuous flowing for a certain period.

The phyloxera is here to stay, in fact has been here since prehistoric times, and wherever it finds congenial conditions and grape vines to grow on, or wherever grapes will grow, there it will be found.

A striking example of the importance of planting resistant roots was referred to by the Lodi Sentinel a few years ago. Two farmers near Lodi planted vines, one on resistant roots and the other on its own roots. When both came into bearing, that on resistant roots produced over twice the amount of fruit produced by the other, area for area. The soil and variety were the same in each case, as was also the culture, but at the end of two or three years those on their own roots were unprofitable, and at a time when grapes were bringing good prices. This man had to pull his vines out and commence over again.

LOTS OF WATER AT CORONA.

A good subscriber at Corona, Riverside county, in referring to a recent item regarding Corona's water supply, sends the following statement regarding conditions there, which certainly must look good to all living in that thrifty community:

The fruit growers of Corona are organized into a mutual company known as the Temescal Water Company. They have two (2) pipe lines. Line No. 1 is 14 miles long, heading at Lee Lake. Line No. 2 is 40 miles long, heading at Ethanac, Perris Valley. Both lines are full and have been for five years, whenever we need the water. The stockholders get their full amount of water every 30 days. The alfalfa farmers have their own water and plenty of it and cheap.

Well prepared country boys are wanted by the great business houses of San Francisco. Write us for information. San Francisco Business College, 733 Fillmore St., S. F.

WHIFFLE TREE INJURY TO YOUNG TREES.

The writer has just returned from a trip of inspection of a young orchard. The call was urgent, but the principal source of trouble proved to be too much whiffle tree, writes W. Paddock, horticulturalist, Colorado Agricultural College. A careless hired man had succeeded in barking a number of trees in a ten-acre apple orchard, and then, in many instances pear blight had gained entrance. The injuries were thus extended. Some of the trees were dead, but in a majority of instances the blight had died out and the trees were making heroic efforts to heal the wounds. But a wound which extends half way around a trunk is slow in healing, and there is danger of the trunk breaking at that point during wind storms. The loss of a five-year-old tree is considerable, so the owner was advised to bridge graft over the wounds. This can be easily and quickly done by fitting cions over the wound. One end of the cion is slipped under the healthy bark on the lower edge of the wound and the other end under the bark at the upper edge. Two or three cions will usually be enough for small trees. Both edges of the wound where the cions are inserted should be well protected with grafting wax, and if the wound is small, the entire surface should be covered. This work is done in the spring of the year at the time ordinary grafting is done.

The cions may unite along their entire length when the wounds are fresh, but more often they do not do so, consequently the tree appears to have several trunks as it gets older. Such trees live as long and are as strong as though no injury had ever overtaken them.

Low headed apple trees are now generally grown in commercial orchards. The time to start the trees to be low headed is in the early maturity of the young trees when transplanted to the young orchard. It often takes courage to cut back the top of the young fruit trees, but it should be done when a low tree is desired.

Malthoid Roofing

F. P. Wilson, owner of the Wilson Building, Dallas, Texas, says: "My roofing laid in 1904 has given excellent satisfaction in every particular. I advise anyone who intends putting on a good roof to investigate the merits of Malthoid before making purchase."

General Agriculture

IMPORTANCE OF BIRDS AS DESTROYERS OF INSECTS.

THE time has long passed when the practical farmer can afford to ignore the relation of birds to agriculture. Larger and larger areas are being devoted to tillage each year, and the amount of capital invested in agricultural pursuits in the United States is constantly increasing. Irrigation, until recently almost unpracticed in the United States, is fast assuming national importance. The whole world is being laid under contribution for new fruits, forage plants and crops for the benefit of the American farmer, in order that by his superior energy and foresight he may not only feed our own people but create a surplus of American products for consumption in less favored lands.

Along with these new introductions and as a necessary result of international commerce, new pests have been introduced. Here, under a favorable climate and new conditions, they multiply till they inflict great damage. The Hessian fly, San Jose scale, and codling moth are examples in point.

Such pests usually go unnoticed until the damage they do forces them on the attention of the community, when usually they are so numerous and widespread that their extermination is impossible. Once introduced into the country they are here to stay, and the vast sums already spent in efforts to stay the ravages of such pests emphasizes the importance of utilizing to the utmost all the allies nature places at our disposal.

As a means of checking these introduced insect pests, as well as native ones, birds are of vast importance. Yet it must be remembered that, when once the reproductive powers of insects have had full play and an invasion occurs, the farmer cannot suddenly augment the number of birds and summon the winged hosts to his aid. Birds reproduce but slowly, and in the natural course of events often suffer immense losses during their migrations, by climatic extremes and through the assaults of birds of prey and predaceous mammals. Hence a marked increase in the number of birds, either as a class or in the case of a given species, must come slowly and as a result of favoring conditions extending over a term of years. Moreover, as stated above, birds alone are inadequate to cope with sudden insect irruptions. It is their province rather by incessant watchfulness and constant warfare to prevent over-production of insect life rather than to reduce excess, although in the latter regard their aid is important. It is the part of prudence, therefore, to protect useful birds at all times, and so to augment their numbers that they may constantly play their respective parts in the police system ordained by nature and be ready, when emergency arises, to wage active and aggressive warfare against sudden invasion of insect enemies.—Yearbook of the Department of Agriculture, 1907.

THE LIFE OF THE FARMER.

THERE is no aspect of human—and we might say animal—life which does not interest the president or which he apparently deems unworthy of the attention of Congress. He has appointed a "commission," consisting of Professor L. H. Bailey of Cornell University, Henry Wallace of Des Moines, Ia., President K. L. Butterfield of the Massachusetts Agricultural College, Walter H. Page, a New York editor of magazines and, of course, Forester Gifford Pinchot, which is to consider "country life" and tell him all about it, so that he can tell Congress, which he engages to do in a special message some time next winter. What the president wishes to be informed about is whatever affects the economic or social interests of the American farmer and which may also be a proper subject for national legislation. He does not ask the commission to make extended original investigation, but to prepare for him a summary of "what is now known" of conditions which affect life in the rural districts.

A COMBINED HARVESTER AT WORK.

What the president desires is evidently to discover whether there is anything which Congress can do which will enable the farmer to get better prices for his crops, or to get larger crops, or to assist him to so spend the proceeds as to live a happier life than he lives now, and a life so attractive to the young people of the farm that they will be less likely to leave it and flock to the cities. According to the president's opinion the farmer, upon whose industry the lives of all of us depend, is falling behind in the race of life. He does not, the president seems to think, get all that ought to be coming to him. Presumably the president will discover from the report of the commission that the fundamental trouble is in the lack of power among the farmers to organize themselves and stay organized. With all other classes organized more or less strongly against him the farmer remains unorganized. As an individual he is engaged in the hopeless task of struggling with organizations. Capital is as well organized as it needs to be and is always competent to make new organizations to meet new conditions. Labor is organized and remains organized by the coercive power of its own organizations. There is nobody in the world, however, to help organize farmers; if they were organized, to boycott scab farmers who sell potatoes below the union price, if there were a union scale. All society, organized and unorganized, instinctively favors the farmer who sells produce at the lowest price, whether it deprives other farmers of the "living wage" or the "American standard of comfort" or not. Unquestionably the farmer belongs to the capitalist class and can succeed by whatever methods are most profitable for other capitalists, but he does not willingly adopt them and can but rarely be induced to do so. This is so well recognized that politicians appeal to him with the same arguments and inducements which they offer to those whose labor is combined not with their own capital but with that of others to produce commodities. The president has never tackled a deeper problem than that of what is the matter with the farmer and how to cure it. If his commission touches bottom with it it will be a wonder. And yet there are not wanting examples in the world of governments which have attacked this problem, and at this distance appear to have done much toward its solution. So far as we know, the greatest meaure of success has been reached by the government of Denmark, which virtually compels Danish farmers to "combine" in certain industries. Possibly the president has that in mind. That, however, would be "un-American," and therefore bad.—San Francisco Chronicle.

GRASSHOPPER DISEASE.

A few years ago a great deal was written for the papers about a certain disease which kills grasshoppers. Nearly every farmer or fruit grower has at one time or another seen the dead grasshoppers clinging to the tops of sweet clover or other plants about their fields.

A few years ago the Colorado Experiment Station sent out about four hundred cultures of this disease to be tested by the farmers who desired to use it in their fields. The station also experimented quite extensively with it upon the college farm and in the surrounding neighborhood. A few of the reports that came in from farmers would indicate that the disease had done great good by killing grasshoppers. Nearly all the reports, however, indicated that the disease did no good. In our own experiments at the station there was only one uniform result, and that was negative in every case. Therefore, I was forced to conclude that the disease does not often do any good when distributed artificially for the destruction of grasshoppers, and I believe every other entomologist in the country who has experimented with this disease has come to the same conclusion.

This disease is a fungus and is present in all agricultural sections of the state where grasshoppers occur. It only needs to have the right conditions of temperature and moisture to cause it to germinate and develop rapidly. When such times occur, the disease attacks the grasshoppers and may kill them almost completely in a large area. The few disease germs that can be added artificially by a person scattering them in the field seem to give no increased benefit.—C. P. Gillette.

The Cultivator had a pleasant and newsy visitor from Phoenix, Arizona, in the person of J. A. Ream, who has charge of several grain and alfalfa ranches in the Salt River valley. His state is surely looking up very rapidly. As the new Roosevelt dam nears completion there is an active demand for land by settlers who see the wonderful future. It is stated that rock is being laid in the dam at the rate of 600 cubic yards per day.

The Glendale people were fortunate this year in realizing about $1 per crate on their cantaloupes.

There are about 10,000 acres in the citrus belt, but alfalfa is the largest irrigated crop, a large market for this being Mexico and the whole of Arizona. All success to them.

California Horticulturally

NEWLY INTRODUCED PESTS.

IT seems that, in spite of all precautions, that California is destined to have all the pests that are going. Within recent years we have seen introduced the purple scale from Florida, the black aphis of the peach, the hop aphis, the white fly and now on top of all the Argentine ant has gained admittance. These pests, all of which are among the most serious to our agriculturists, have found entrance within a comparatively short period and have become so firmly established that we will have to combat them in the future and count upon them as so many scourges of the farmer. We had prided ourselves upon our freedom from these scourges and fondly believed that they could not gain admittance, but they are here and have got to be reckoned with. The black aphis of the peach is as serious a pest as is the wooly aphis of the apple, and like that pest, it has both root and branch forms, so that it is not easy to combat. The hop aphis is the most serious scourge of the hop grower, and its absence in our California yards in the past gave our growers a great advantage over those in other sections where the pest was prevalent, but it is with us now, and our hop growers have no advantage over their neighbors. The white fly is too well known, and is still a threatening danger to our citrus growers over the whole state, for its extermination is impossible and it is only a matter of time when it will break out again. And now, on top of all, we have the Argentine ant, which, according to authorities, is one of the most serious of all, as it does not confine its attacks to vegetation but it is a general feeder and attacks everything in its path and nothing can stand before its ravages. Surely the good and the bad do equally well in California.

HOP GROWERS' TROUBLES

Hop picking season is now on in the hop yards of Sacramento and adjoining counties, and the hop men are having a strenuous time. Prices this year are ruinously low and wages of pickers have been reduced. Last season good prices were paid for labor and the pickers are demanding the old rates. It now looks as though very much of the present season's hop crop will be left unpicked as it will not pay to gather it.

INCREASING SHIPMENTS OF FRESH FRUITS.

So far this season there have been shipped nearly six thousand cars of fresh fruits from Northern and Central California, with half the shipping season yet to come. Last season the total shipments were 7,491 cars and in 1906 there were 6,305 cars. There yet remain to go forward large quantities of late fruit, the bulk of the grape crop and nearly all the apple crop. It is probable that the fresh fruit shipments this season will exceed 10,000 cars. These figures will give some idea of the very rapid growth of the fresh fruit business in the Northern part of the state.

GOOD MOVE OF THE TABLE GRAPE GROWERS.

There has been much complaint from commission men in the East as to the shipment of green and badly packed grapes from California, and this has had the result of lowering the prices of such as were honestly packed. This, together with the rapidly increasing new acreage, which is annually coming into bearing, has caused the growers of Lodi much uneasiness and in consequence the Chamber of Commerce of that city has taken measures to stop the evil if possible. An effort will be made to reach all packers and shippers to induce them to pack and ship only fully ripened and marketable fruit. Should moral suasion fail, a farther effort will be made to bring forceful pressure to bear on the culprits. It is recognized that if the present practice of shipping green and immature grapes to catch the early market is persisted in, the eastern trade will be driven out and a great horticultural industry be ruined.

FLAX GROWING IN THE SACRAMENTO VALLEY.

Flax has been successfully grown to a greater or less extent for several years past in the lower San Joaquin and upper Sacramento valleys, but no concerted effort has been made to produce it on a large scale or in commercial quantities. The coming year, however, promises to see this valuable fiber plant grown on a large scale and to introduce its production as a commercial proposition in those sections. Mr. J. Everding, representing a large manufacturing establishment in San Francisco, is now closing contracts with farmers for the growing of flax for the seed, guaranteeing them $2.20 for all flax seed produced. Very many farmers have already signed up with him and will seed the flax next season. It is claimed that flax will do well on exhausted grain land, on account of its roots penetrating the ground much deeper than wheat and by this means striking a fertile subsoil.

LOW PRICES FOR ALMONDS.

Almonds are now being harvested and the crop is turning out very good in spite of early fears to the contrary. There is a very large acreage devoted to almonds in Yolo, Contra Costa, Yuba, Sutter and Butte counties, and it is here that the great bulk of the almonds of the state are grown. The almond is a very uncertain crop, even in these counties where it gives the best results, and a good crop can only be expected about every third season. The tree blooms very early, usually in the latter part of January or early in February, and there is always danger of losing the crop from a late frost or high winds. This year the yield has been fairly good, but prices are not in any way satisfactory, buyers offering only 9½ to 10½. Most of the growers, who are not compelled to dispose of their fruit are refusing these offers and will hold for better prices.

INCREASING ACREAGE OF DECIDUOUS FRUITS.

There has been a steadily increasing interest taken in deciduous fruits in the upper counties for several years past, especially in the way of planting peaches and table grapes, and from present indications the new plantings of the coming winter will exceed those of any other previous year. Already heavy orders have been placed with the nurserymen of the state and in order to supply the demand orders have been placed with eastern nurserymen. The building of electric roads into the agricultural sections has had the effect of cutting up some large holdings there into small tracts and the greater part of these have been purchased with the intention of converting them into orchards, and a large part of this acreage will be planted to trees during the coming winter months.

PEAR BLIGHT DECREASING.

For some reason, so far unknown, there has been very much less destruction from pear blight this season than for five years past. Fungous diseases have not been very troublesome, but this can be accounted for from the fact that we had a very dry spring, and it is probable that the fungus spores failed to germinate owing to climatic conditions. But, inasmuch as the pear blight is not a fungous disease, but is caused by a bacillus, which spreads through the cambium, this theory will not account for its lessened prevalence. It is often the case that diseases which are sometimes violently epidemic run their course, as it is said, and cease to be violent. Perhaps some natural check overtakes them and while they may still exist, their early virulence has been expended. It may be so with the pear blight, and certainly it is to be hoped that such is the case. In any event the disease has let up on us to a great extent during the present year and there has been a very good crop of good Bartlett pears.

POTASH

is the essential element in the growth of hardy stock and the formation of the fleshy portions of fruits.

Commercial fertilizers do not always contain a sufficient proportion of this most valuable of plant foods.

The increase of the Potash element will work wonders in the production of superior fruits and the longevity of the parent stocks. It will make its own demonstration in the larger profits secured.

Ask for our **Free Books** on fertilization in every branch of farming, fruit growing and gardening, compiled by experts and filled with valuable information.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

The Benefits Derived by Using a TUBULAR

are so many, that after a man buys one, he wonders why he waited so long, to "get wise."

Don't you wait and then regret; but investigate, now, the superiority of the Tubular Separator.

Easy filling—Waist low supply tank.
Easy turning—Light running, self oiling gears.
Easy cleaning—Simple (3-part) bowl.
Clean skimming—Suspended bottom fed bowl.
Durability—Made to stand wear and tear.
Economy—Less attention—less repairs than other separators require.

These are some advantages found in the Tubular, only. To learn more write for Catalog 260.

Live Stock and Dairy

TEACHING OF A DRY YEAR.

IT SEEMS that no matter how long we own a piece of land, that every season by the variations of rainfall, brings new conditions. It makes ranching of interest, too, meeting the new and unexpected obstacles as they arise. Maybe I should be ashamed to confess it, but I never realized, as I have this season, how many animals could be kept fat on a limited amount of alfalfa land. The profits of soiling are great. The expense, when it is made one man's work to cut and haul in the green alfalfa, does not increase greatly. The increase in expenses of feeding is more than met by the increased amount of feed grown on the land. It is wasteful to pasture land. I doubt if, after this season, I shall put the cows out in the larger fields. They only need a place large enough to exercise and then to ruminate in peaceful shade and that is easy to provide. The fields will be saved for growing feed and not for tramping around, after this season.

Feeding.

The long silage racks are used for the freshly cut alfalfa, as well as for the hay and corn stalks. These racks are made in lengths convenient to be pulled by a pair of horses and are removed to fresh ground when the feeding places become muddy. The racks are built on skids and are solid mangers with a high center solidly boarded up. The cows are dehorned and cannot hurt each other with their butting. The high centers prevent their seeing each other across the mangers. Should there be a boss cow standing at one side and keeping the others from eating, the other side affords more space. When there are several mangers, there is plenty of food after the unkind animal moves away for the others. There always should be sufficient food in the mangers to leave enough for one more animal. This the horse that draws the milk truck finds for his evening feed after the cows are turned out. Always enough feed for one more, is the same rule that the Chinese cook works by in feeding the men. The food must be abundant enough for one more hungry man, then there is enough and no waste.

Alfalfa.

Now Gov. Hoard has come out declaring the wonders of alfalfa as a cow feed! Do we really appreciate it enough? It is so far superior to anything else that we can plant on the same piece of land when we are feeding horses or cows that all other crops sink into insignificance. Alfalfa is coming more and more into repute for feeding beeves. A late paper tells of a Nebraska man receiving the highest price paid by Swift and Co., since 1902 for a carload of steers raised on alfalfa and corn. At the National Live Stock Exhibition to be held next December in Omaha, there will be an alfalfa palace; it will contain samples of alfalfa, as well as a complete line of harvesting tools for the alfalfa fields. The building will be used to give lectures on balanced foods; particularly alfalfa against corn and other grains.

Hungarian Millet.

Well, this crop with us has proven, this year, a total failure. The seed sprouted well in the flat, planted in the lath house, so we cannot scold the seed man. Why did it fail? The land was irrigated well; even after that ten weeks the land has moisture within reasonable distance from the surface The seed bed was carefully prepared. The intense heat came about that time and may have cooked the young plants as they appeared above the ground. This is the only reason that we are able to give at present for the utter failure. It is not even a hundredth part of a crop, it is a complete failure. Well, it will have to be tried again next season for it has proven before in a small way to be too good a crop not to bring into field culture on the ranch. Any crop that will grow after the grain hay is cut has great value in the San Joaquin valley. The loss of a crop is often the first step toward wiser farming; it brings on a thinking spell and one ponders over it until at length the reason becomes clear and another light dawns on the why. Next year we will sow millet under three or four conditions. and at three or four different times. Then perhaps we will know why this year's crop failed.

The lack of crops that are at full feeding value in the winter is great. The Oregon winter vetch is promising as a feed crop and as a cover crop in the vineyards.

Lack of Inspection.

This may seem a sudden jump from soiling to cows, but the matter is of great importance and should be spoken of early. The lack of inspection in the dairy caused by insufficient appropriation of money by the last legislature has resulted in a drop in the quality of California butter. The Creamery Operators' Association has called the dairyman's attention to this. fact. At the Stockton meeting in 1906 and again at Davis last year, the association passed resolutions asking the legislature for funds for the State Dairy Bureau. There was an act passed by the legislature which provided that the dairy interest should be controlled by other stock interests. This would have been very unfortunate and the Governor wisely vetoed the bill. The association desires to protest against any interests controlling the dairy inspection and sanitation other than the dairymen. All dairymen will do well to write to their representative and ask him to support the dairy interest by voting only for bills that leave the dairy interests in the hands of men who understand them. So vote for the Dairy Bureau with sufficient funds to support its work. The state control of dairy sanitation reaches the outside creamery men and brings up the quality of the butter rather than the milk. The local city boards control the milk supplies and are not interfered with in any way. Intelligent state control, however, does educate the city health boards and some of the amusing and crude local restrictions are passing away.—M. E. Sherman.

The cow is a business proposition. If you put $50 out at interest you would consider yourself lucky to get $5 annual interest, yet the profitable dairy cow should bring in at least $30 net profit. It is easy to see that it does not pay to keep any but profitable cows.

The first cutting of alfalfa at Twin Ridges, Montana, was made near the end of July.

HOG CHOLERA INVESTIGATIONS.

Continued investigations with hog cholera have again demonstrated that the contagion consists of a virus which exists in the blood and other fluids of diseased animals, but which can pass through the finest filter, is invisible under the microscope, and, therefore, cannot be isolated or discerned by any of the usual methods.

The method of immunizing hogs against cholera has been tested much more extensively and the results show quite clearly that a comparatively certain method of protecting hogs from this disease has been secured. Hogs that have recovered from this disease or that have been exposed without contracting it are injected with suitable amounts of virulent blood from diseased hogs, and thus their immunity is heightened. The blood serum of these immunes is then used in vaccinating the hogs which it is desired to protect. The method giving the best result is to inject blood from diseased hogs simultaneously with the immune serum. By this method of vaccination hogs are protected for three and a half months or more, while by the use of the serum alone the protection cannot be expected to last longer than three weeks. The immunized hogs probably retain for several months their power to furnish a potent serum. The serum probably cannot be used successfully as a curative agent unless administered within four days after actual infection has taken place.

In order that this method may be more extensively tested, it is expected to make arrangements for the State experiment stations to test serum which will be furnished them by the Department. It is hoped that the practicability of this method for combating hog cholera may thus be determined within a short time.—James Wilson, Secretary of Agriculture, Annual Report.

PREVENTING HOG CHOLERA.

Prof. Sackett and Dr. Glover of the Colorado Agricultural College, attended the hog cholera meeting at Ames, Iowa, recently. At this meeting were representatives from the experiment stations of a large number of states. These experts met there at the solicitation of the chief of the U. S. Bureau of Animal Industry. The government experts have worked out a serum which will prevent hog cholera. It is predicted that there will be such a demand for this serum that the government will not be able to supply all the states, as it has done with black-leg vaccine and tuberculin. It is expected that each state will manufacture its own hog cholera serum, and it was in order to give complete instructions in the details of making this serum that the experts of the different states were invited to visit the government station at Ames, Iowa. It is hoped that arrangements may be made so that this serum may be produced for distribution throughout Colorado. It will probably be at least two months before much can be effected along this line.

When you hang a lantern up in the barn, fasten it so that it cannot be knocked down. Sometimes we put them where they will fall if we by accident rise and hit them with our heads. And then—well, then there is trouble; and maybe the barn is not insured, either.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

KOUMIS.

Koumis milk is simply milk in which the alcoholic fermentation has been developed, usually by means of yeast. This gives a taste and smell somewhat like buttermilk or slightly sour whey, and it has a foamy appearance. The cascine is in the form of a very fine curd. In European countries it is usually made from mares' milk.

Directions for making koumis are printed in a number of books. One of them is to add 42 parts of water to 100 parts of skim milk; to this mixture add 1¾ parts of cane sugar, about eight tenths of 1 part milk sugar and 160 to 180 grams of yeast. This is allowed to stand for 32 hours at a temperature of about 100 degrees F. While the mixture is standing it is stirred about once in five hours. It is then poured off into bottles which are corked and the cork fastened in the bottle by means of a wire. These bottles are allowed to stand at a temperature of about 54 degrees F.; at the end of six days the milk will be sour and have a sparkling and foamy appearance with the characteristic taste of koumis. Koumis is extensively used by invalids and people with stomach trouble.—Hoard's.

HOW TO FEED COTTONSEED MEAL TO HOGS.

In a bulletin issued by the Texas Agricultural Experiment Station, the following information is given as to the way to feed cottonseed meal to hogs:

1. For animals on heavy feed, that not more than one-fourth the weight of the grain ration consist of cottonseed meal.

2. That this feeding continue not more than fifty days, or that the proportion of meal be reduced if feeding is to be continued longer.

3. That the meal be mixed with the other feed and all soured together.

4. That as much green feed as possible be furnished the hogs.

5. That a close watch be kept, and meal be taken from any animals not eating or gaining well.

EATING UP SHEEP.

The world is eating up its sheep. The number on foot is steadily being diminished and the same is true of cattle and poultry, says the London Meat Trades Journal. From the available statistics it is said that in three years should there be no increase, at the present rate of consumption every head of cattle, every hog, every sheep and chicken in the barnyards would be eaten up. It has been noticeable for several years that the number of food animals raised throughout the world was steadily decreasing. The question is, unless conditions are modified, and that shortly, from where are the meats of the future to come?

RAIDING DOCTORED MILK.

The greatest milk raid in the history of Cincinnati, O., took place last week at the Central Union Depot when 17,000 gallons of milk was made unsalable by order of Milk Inspector Hagen and assistants, who poured red ink into all found to be doctored with formaldehyde and other preservatives. Then the shipper was left to do what he pleased with the carmined milk. The raid was entirely unexpected by the dealers, and there was considerable excitement during the several hours in which the milk was inspected.

Clip Your Horses

with this superb Stewart No. 1 Ball Bearing Clipping Machine

The great enclosed gear machine at your dealers all complete, as shown, only $8.50

No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.

It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

If your dealer hasn't it, write us direct. GET ONE NOW

Contents

SACRAMENTO VALLEY FRUITS, Cover.

REVISE HORTICULTURAL LAWS, 219.

CITRUS.—The Proper Time to Use Stable Manure; Small Growers Should Wake Up; More Reasonable, 220, 221.

DECIDUOUS.—Picking, Grading and Packing Apples; Budding Walnut Trees; Resistant Grape Roots; Whiffletree Injury, 222, 223.

GENERAL AGRICULTURE.—Importance of Birds as Insect Destroyers; Life of the Farmer; Grasshopper Disease, 224.

CALIFORNIA HORTICULTURALLY.—Newly Introduced Pests; Hop Growers' Troubles; Increasing Shipments of Fresh Fruits; Good Move of Table Grape Growers; Flax Growing; Low Prices for Almonds; Increasing Acreage of Fruits; Pear Blight Decreasing, 225.

LIVE STOCK AND DAIRY.—Teaching of a Dry Year; Hog Cholera; Preventing Hog Cholera; Koumis; Cottonseed for Hogs; Eating Up Sheep, 226, 227.

EDITORIAL.—The Electoral Vote; Use Your Eyes; No White Fly; Alaska Wheat, 228.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 229.

POULTRY.—Flavor of Egg and Color of Yolk; Vitality; Easy Poultry Keeping, 239, 231, 232.

SMALL FRUITS AND VEGETABLES.—Cabbage Worms; Things to Remember in Berry Growing; Weeviled Peas, 233.

QUERIES AND REPLIES.—Grape Juice; Cover Crop; Cover Crops for Walnuts; Fumigation; Rhubarb; Tuberculosis; Tipping Loganberries; Raising Onion Seed, 234.

ORNAMENTAL GARDEN.—Italian Gardens; Care of Gold Fish; Mildew on Roses, 235.

HOUSEHOLD.—My Choice; A Case of Stolen Thunder; Recipes, 236, 237.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 238, 239.

THE ELECTORAL VOTE.

As the electoral college this year will be composed of 483 electors, 242 voting for Mr. Taft or Mr. Bryan, will elect him the next president. The Washington Post, which keeps about as accurate tally on the politics of the country as any newspaper recently published a map of the 46 states, lining them up as follows:

Conceded to be Democratic—Nevada, with 3 electoral votes; Oklahoma, 7; Texas, 18; Missouri, 18; Arkansas, 9; Louisana, 9; Mississippi, 10; Alabama, 11; Georgia, 13; South Carolina, 9; Florida, 5; Tennessee, 12; Kentucky, 13; North Carolina, 12; Virginia, 12 and Maryland, 8—16 states, with 169 electoral votes, or 73 less than the number necessary to elect Mr. Bryan.

Conceded to be Republican—Washington, with 5 electoral votes; Oregon, 4; California, 10; Idaho, 3; Wyoming, 3; North Dakota, 4; Nebraska, 8; Kansas, 10; Minnesota, 11; Iowa, 13; Michigan, 14; Wisconsin, 13; Ohio, 23; Pennsylvania, 34; Rhode Island, 4; Masachusetts, 16; Vermont, 4; New Hampshire, 4 and Maine, 6—20 states with 193 electoral votes, or 49 less than the number necessary to elect Judge Taft.

Doubtful—Montana, 3; Utah, 3; Colorado, 5; Illinois, 27; Indiana, 15; West Virginia, 7; Delaware, 3; New Jersey, 12; Connecticut, 7; and New York, 39—10 doubtful states, with 121 electoral votes in the balance.

The above will be handy to refer to during the campaign. Mr. Bryan must secure 73 of the doubtful votes and Mr. Taft must have 49.

USE YOUR EYES.

A correspondent in an Eastern paper says that if he were asked to name the most essential trait required to achieve success in agriculture it would be observation. But few of our farmers are able to tell the names of the weeds and insects and birds with which they come in contact every day. It may be asked of what practical value is this to the farmer. That knowledge of itself it may be granted would be of little immediate value but the habit of observation and the training secured in acquiring that knowledge would be of great value.

This is made apparent every day in the office of the Cultivator by the manner in which a query is made for information. One farmer will write an intelligent statement of conditions and state it in a way which shows he has closely observed every step in the diseases or growth or trouble about which he inquires. More are liable to send in the merest statement of fact that some trouble is encountered, from which we are expected to give an intelligent answer. For instance, it is common for a gardener to write in and ask as to manner of control of "little green striped lady bird." As has been mentioned in the columns of this paper before, that particular bug is not a lady bird at all but the common squash bug or Diabrotica. This insect is always the enemy of the gardener while the lady bird is almost invariably his friend. The farmer should train his eyes to distinguish between his friends and enemies.

Again the trained eye detects the injury which insect life may be beginning on the young plant before the plant is injured beyond saving. For instance the injury caused by the red spider is often not observed at all by the fruit grower until the millions of insects which have caused the damage have finished their life work and when first observed may all be dead. Treatment at such a time would be useless and expensive.

Reading of best and latest literature pertaining to up to date farming is valuable to any farmer but still more valuable is the habit of keeping open eyes to the little things that are daily occurring while he is at work in the fields.

NO WHITE FLY.

Several papers have referred to reports of the existence of white fly in the Tulare country citrus orchards. From them the item was taken for the little news notes of a recent Cultivator. The report was later denied and we have written to several in Tulare county to ascertain the facts in the matter. Mr. Arthur E. Miot, secretary and manager of the Tulare County Board of Trade, replies: "I have referred the matter to the Horticultural Commission. So far as we have been able to discover no white fly has been found but the commission is on a diligent hunt for it and when it replies to you the answer will have official sanction." After the letter is signed Mr. Miot adds the following note: "Mr. C. S. Riley of the Horticultural Commision has just dropped in and tells me that Mr. Strong of the State Board of Horticulture has been here for several days for the express purpose of investigating the white fly matter. Thus far none whatever has been found."

It is gratifying indeed to know that none of this serious pest has been found in Tulare county. The fight in Butte county has been most successful and it is very probable that under California's vigorous campaign it will be completely eradicated. Therefore, if it does appear in Tulare county it is best that it should be known at once and the campaign started for complete eradication.

Meantime the County Commission is to be complimented for its vigorous search for the dread pest.

Since the above is in type the following have been received. The first from W. E. Sprott, secretary and manager of the Tulare County Citrus Exchange:

"A pretty thorough examination has been made by our horticultural commissioner and not a single fly has as yet been found, and it is my opinion that none exists here or has ever existed in this county. The boxes mentioned in your letter were burnt within a few hours of their arrival, and the whole premises in which some of the boxes had been placed were thoroughly fumigated."

The following from Commissioner Schultz:

"A few weeks ago I received a letter from one of the professors at Berkeley informing me that an expert from Washington had made a tour through this part of the State, and in his investigations had discovered the white fly at Visalia and at Chico. I at once notified the other two members of our horticultural board, and we started to investigate the matter, but could not find any indications of its existence in the county. I also wrote to Mr. Jeffrey, and in his reply he told me that he had two experts at work at Chico, and that they could not find the slightest evidence of its existence there, and that he would send Mr. Strong down there to investigate our section. In the meantime Prof. Clark of the State University looked over the field and he reported that he was unable to discover anything in the shape of white fly.

"The past week Mr. Strong arrived, and made a very careful investigation, also reported that he was unable to find any evidence whatever of its existence here.

"From all these facts it would seem that our expert from Washington was mistaken, if he ever made the report attributed to him."

ALASKA WHEAT.

Papers the country over are continuing to print more stuff regarding the Alaska wheat. This is perhaps more general than it otherwise would have been had not the Saturday Evening Post of Philadelphia given such extensive articles generously illustrated. It is presumed that the Post is too big a paper to permit the sale of its reading columns in this manner. If such is the case, then it must have been caught napping with what now appears to be a fake of the first water.

We recently quoted from a report of the Colorado Experiment Station. We now note the following by James Withycombe, Director of the Oregon Experiment Station:

"It is not our purpose to discourage the introduction of a new and valuable variety of wheat but we are frank to confess we are somewhat incredulous as to the value of 'Alaska' wheat. While we have not had an opportunity of seeing the 'Alaska' wheat, nevertheless the description and cuts published correspond very closely with the characteristics of a variety of wheat known as 'seven-headed,' or 'Egyptian' wheat. This wheat has been grown on a small scale at this station for some years, and we find it to be of little commercial value. Hence we suggest that our farmers do not become too enthusiastic over this new wheat until its merits have been more fully and conclusively demonstrated."

The State is making an annual appropriation of $5000 to better the quality and quantity of our cereals. Forty acres and more on the farm at Davisvile are devoted to this work, and much good is being accomplished.

Shop Talk

DRY FARMING BOOK.—As was suggested last week, editorially, now is the time to think of next year's crop and how it is to be handled. There is much more dependent upon the preparation of the soil for seed than many farmers know about. Especially in the West where the rainy season is a little uncertain, knowledge along this line is of great value.

As has been suggested before H. W. Campbell's "Dry Farming Manual" seems to fill this need and the **Cultivator** is receiving orders for it. For a short time we are going to make the **Special offer** of a **years subscription with the book** at the regular price of $2.50. The manual is the 1907 issue and is the latest out. There will never be opportunity to get it at a better figure than this and we suggest that all interested take advantage by remitting and renewing at once.

FILE AND INDEX.—"I consider the Cultivator a very valuable paper for any man. I would feel almost lost without it. I have taken it nearly five years and have never missed reading all of every paper, and they are all on file with an index book kept, referring to such articles as I think I may need in the future."—C. F. Lathrop, Imperial.

Agricultural Notes of the Pacific Coast

Northern California

Humboldt county is making a strong move for good roads.

Sixty thousand small trout are to be released in Shasta streams

A sugar factory at Hamilton City is now running at full capacity.

Farmers at Gridley, Butte county, are making a reputation for growing fine mules.

Vacaville has shipped 750 cars of green deciduous fruit as against 412 last season.

Two canneries at Yuba City and one at Marysville are handling about 6000 boxes of fruit daily.

Sacramento county will make a big exhibit of agricultural products at the coming state fair.

Mendocino county hop growers will pay 80 cents per hundred for gathering the season's crop.

Sacramento valley expects to have in the neighborhood of 8000 hop pickers at work this season.

Yuba City canneries are appealing for help, having suffered from a shortage for some time.

The Ukiah cannery is in full swing after being thoroughly overhauled and new machinery installed.

Yuba City packing house started on the packing of Sutter county figs Monday of this week.

A delightful meeting was held by the members of the Sonoma County Grange at Two Rock last week.

The general price paid for picking hops over the Sacramento valley this season will be from 70 to 80 cents.

Thorough inspection of orchards at Oroville, Butte county, has failed to develop a single specimen of white fly.

Galt dairymen have formed an association. George Orr is president and W B. Sawyer secretary and treasurer.

Orange growers at Oroville are appealing for a quarantine to be established against citrus trees and fruit shipped in from Marysville.

Gridley has hundreds of acres of cucumbers which will be picked and delivered to the Pacific Pickle and Vinegar Works at Hayward.

Sutter county fig orchards are in sight of a fine crop this season and the same orchards have for several years proved very profitable.

Sutter county wine grape growers are contemplating leaving their grapes unpicked, owing to the unsatisfactory condition of the grape market.

Gridley is appealing for the production of more water melons, as it is claimed to be one of the finest watermelon producing sections of the state.

It costs about 7 cents a pound to grow and put hops upon the market and the grower sees but little left to him for his year's work at present prices.

Yuba and Sutter counties will have record crop of fruit this season. One report from Marysville says that over 600,000 pounds of fruit are being marketed daily.

Prices paid by creameries of Humboldt county for August delivery were: Capitol 24¾, Central 25½, Cream City 25½, Eel River 25¼, Ferndale 25½, Grizzly Bluff 25¼, Pioneer 25, Riverside 25.

Central California

Lodi shipped 555 cars more peaches this year than last.

Some Kings county harvesters have closed the season's work.

Santa Clara valley is making a strong pull for better roads.

Red spider has done much damage to shade and other trees about the town of Bakersfield.

Thorough investigation has failed to develop any white fly in Tulare county.

One farmer near Hanford has a net return of $164.50 from four acres of beets.

Fresno will make a large exhibit at the National Irrigation Congress at Albuquerque.

Kern County Fair Association expects to have a $3000 fund to commence her fair this fall.

The Kings County Fair Association has reversed its former decision and will now hold a fair this fall.

Turlock watermelons are selling from $8 to $12 dollars a ton and about 16 carloads per day are being shipped.

The California Wine Association has refused to buy wine grapes this year at any price, but will crush for the grower "on shares."

Kings River Power Company has filed notice of appropriation of 40,000 miners' inches of water from the King river for the purposes of power.

At a meeting of the San Jose grange recently especial emphasis was laid on the need for constant vigilance against the caterpillar and the Argentine ant.

The forest supervisor of the San Benito Forest has accomplished much good by selling off large quantities of dead timber wood which was a menace in time of forest fires.

Congressman Smith, who made a speech against parcels post in Congress last fall is attempting to make good before the Tulare county grange by making a speech there in the near future.

About 700 tons of hold-over raisins, property of the Kearney estate, were offered for sale and the highest bid was 3¾ cents. It is claimed, however, that many sales have been made at as high as 4 cents

Watermelon growers in Stanislaus county have been benefited by war amongst watermelon buyers. Until recently $6 a ton was a liberal price. A new company entering the field has nearly doubled that price.

The Tulare county Board of Trade has an exhibit in the city of Visalia, which is a credit to the fruit producing industries of that county. Mr. Miot reports he is putting up some magnificent specimens for exhibition purposes.

Sweet potato growers of Turlock have formed a co-operative company for their mutual advantage. There are 28 members representing 750 acres. They will sell only their own potatoes. J. C. Williams is president.

A 3000-acre grass fire near Bakersfield is reported to have been caused by an eagle coming into contact with live wires of the Edison Power Company, which caused its death, and as it dropped into the grain fields below, its burning feathers started the fire.

Southern California

Orange county will produce at least 3000 cars of celery this season.

Several apricot orchards near Highland have been uprooted because of lack of profit.

Six cents seems to be the maximum price offered Ventura county apricot growers.

The Redlands Citrograph prophesies the coming season will be one of excessive rainfall.

Chino, San Bernardino county, finds the barley crop to be far heavier than anticipated earlier.

Thieves at East Whittier have been busy robbing orchards of young trees just planted.

Scipio Craig of Redlands will be one of the delegates to the National Irrigation Congress at Albuquerque.

A grain grower near El Toro, Orange county, recently lost about 400 sacks of unthreshed barley by fire.

The acreage in beans is rapidly increasing in Orange county. Limas and blackeyes are the two favorites.

H. E. Huntington recently paid $150 for one palm tree with which to ornament his estate near Los Angeles.

It is estimated that over 100 deer have been killed in the mountains surrounding Antelope valley this season.

Six of the latest improved wrapping machines are being installed in the Producers' Packing House at Redlands.

A creamery man offers to establish a creamery at Brawley providing a sufficient number of dairy cattle is pledged.

Corona shipped three cars of honey to eastern markets last week. There is but little more to forward from that district.

Negotiations are closed for the sale of 600 acres near Winchester, Riverside county, which will be used as a poultry colony.

Many poultry growers are gathering "Blue curl" for the purpose of making nests. It is said to keep away all vermin and mites.

Ranchers between Anaheim and Cypress are loading their guns for automobile drivers who are overbearing in their use of the road.

A Whittier bulldog caused great commotion and a lawsuit by breaking into a Belgian hare ranch and killing 400 bunnies. The suit is for $299.99.

The weather has been too dry to be entirely satisfactory to bean farmers at Mound, Ventura county. They wish for some old-fashioned dripping fogs.

Construction of a half million dollar sugar factory at Santa Ana is progressing satisfactorily and next season's planting of that section will be about 2500 acres.

The weigh master of the beet dump at Huntington Beach received on a recent Saturday 240 tons of beets in three hours. This is said to be the record of any beet dump so far as known.

Orange county chili pepper crop is backward in maturing this season. In former years, first shipments have been made to the canneries about August 23. It is claimed this year there will be no such shipments made before September 1st and possibly before the 10th.

The Coast

Caldwell, Idaho, County Fair will be held October 6th to 10th.

The apple output of Klttitas will aggregate over 50,000 boxes.

Miles City, Montana, County Fair will be held September 8th and 10th.

Spokane and Eastern Washington are supplied with sweet potatoes from California.

Creamery butter is selling at 30 cents per pound at Walla Walla, Washington.

Wenatchee, Washington, is having the biggest output of fruit which it has ever shipped.

Walla Walla, Washington, has 4,000,000 bushels of grain to move to tidewater this season.

More than 500 acres of land in Linn county, Oregon, are devoted to commercial walnut culture.

Eastern Washington wheat growers are largely following the plan of early sales of wheat this year.

A Pullman, Washington, farmer has just sold his 4500 bushels of wheat at 82½ cents a bushel.

Apple growers of Puyallup valley, Washington, propose to capture many of the prizes offered by the National Apple Show.

Hubbard, Oregon, is busy harvesting a large crop of onion sets, which is a specialty of the farmers on Pudding River bottom.

Arizona has enjoyed exceptionally heavy rains during this season, the heaviest at Flagstaff aggregating 4 inches within one week.

Professor W. L. Carlyle, Dean of the College of Agriculture, Colorado, has declined a proffer of a position at the Kansas Agricultural College.

Railroad men and farmers near Colfax, Washington, are to hold a conference and discuss the question of transportation of farm products.

Pear blight is reported to have appeared at Prosser, Washington, and the pear growers are appealing for inspectors to direct the fight against it.

J. G. Smith, termed the "Father of Farming" in Hawaii, has resigned as special agent in charge of the Hawaiian Agricultural Experiment Station.

A Camas prairie farmer harvested this season 1300 sacks of barley from 46 acres. It all graded as number one grain. This is an average of 85 bushels per acre.

The wheat crop of Lind, Washington, is being marketed at Tacoma, and shows up as number one, averaging 58 pounds to the bushel. The price paid is 72 and 75 cents.

Russian thistle and Jim Hill mustard at Wenatchee, Washington, are proving most exasperating and calling for more complete organized effort for their extermination.

A farmer at St. Joe, Idaho, marketed 93 pounds of peppermint oil from two acres of mint. This sold at an aggregate of $372 from the two acres, or a net gain after expenses were paid of $302.

The government experiment station at Bellingham, Washington, is receiving a large shipment of bulbs from Holland, which will be tested in that section with an idea to commercial culture.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FLAVOR OF EGG AND COLOR OF YOLKS.

THE West Virginia Agricultural Experiment Station has the following on the influence of food on the flavor of eggs and color of yolks:

During the winter of 1902 and 1903 a number of experiments were conducted to learn as to the effect upon the flavor of eggs of feeding different foods and flavoring materials. It is quite unnecessary to say that if eggs could be produced having a more agreeable flavor than ordinary eggs they could be sold to special customers at a considerable advance over the usual market rates. The grains fed either alone or in combination for this purpose included corn, wheat, oats, Canada field peas, peanuts and sunflower seed. The flavoring materials employed were celery oil, oil of sassafras, and certain organic chemical compounds of marked flavor. Beet scraps were fed to balance the different rations except in one case when smoked herring were used. The green food supplied consisted of sugar beets which were readily eaten.

Quite contrary to expectation the flavor of the eggs was not noticeably altered by any of the rations or flavoring materials employed, although it has been shown by investigations at the North Carolina Station that the feeding of onions imparts a very distinct and undesirable flavor.

The different rations, however, very clearly affected the whole color of the yolk, when the grain ration consisted of wheat, oats or white corn fed either alone or in combination with each other, the yolks were so light colored that the eggs were quite unsuitable for a fancy trade. When the grain supply consisted entirely of white corn the yolks were very light colored, while on the other hand, the feeding of yellow corn imparted to the yolks that rich yellow color which is so desirable.

POULTRY BREVITIES.

Corn is a more expensive poultry food on the Pacific Coast than barley.

* * *

For preserving eggs in water glass use one part of water glass to 10 parts of boiled water.

* * *

In buying concentrated poultry foods buy on the basis of the per cent of protein or nitrogenous material—to illustrate:

One hundred pounds of corn costs $2.00 and contains 7.8 pounds of protein. The digestible protein in this costs 25 cents per pound. One hundred pounds of cocoanut oil cake costs $1.60 and contains 16 pounds of protein consequently the cost per pound is 10 cents.

* * *

"Sports."

I have White Wyandottes. The eggs and stock were bought from breeders that have an excellent reputation. I frequently have chicks with single combs and some with black feathers. Should pure bred stock produce such results?—C. M. K., Tuscon, Ariz.

There are no breeds of domestic poultry but will throw birds with some "outs" in the way of combs and colors that are not standard, while White Wyandottes are a comparatively recent creation, hence more likely to throw birds with defects than older breeds. Single combs will show themselves in Wyandottes for many years to come and black feathers will appear more or less frequently as in all white breeds.—S. S. T.

* * *

Feeding Problems.

Under the head of cheaper feed, in reply to J. R. K. Gridley, in a recent Cultivator, you recommend feeding barley instead of wheat. Do you think hens will lay as well if fed entirely on barley for one meal and a mash feed for the other meal? I am feeding equal parts of rolled barley and wheat at night and a mash of three parts bean, one part middlings, one part corn meal, one part rolled barley (the barley is cooked,) one part alfalfa meal and one-half part meat meal.

Now, if I should feed whole barley at night and use uncooked rolled barley in my mash, do you think I would get as good results as to feed the way I am feeding at present?

I can get barley about 50 cents a hundred less than wheat, which is quite an item when feed is so high.—C. H. P., San Jose.

There is no doubt you would get equally good results by feeding whole barley once a day, and a dry mash fed in hoppers, to which the hens have access at all times. There is no advantage to be gained in cooking rolled barley.

It has been proven at various times by definite experiments that there is nothing to be gained by cooking grain for animals.

Of the substances you are feeding I would suggest the following proportions, the conditions of which are indicated below:

	Dry matter.	Protein.	Carbohydrates.	Fat.
25 lbs. whole barley	22.20	2.35	14.90	.55
20 lbs. corn meal	17.60	1.28	13.24	.68
25 lbs. rolled barley	22.20	2.35	14.90	.55
10 lbs. alfalfa	8.90	1.38	3.70	.16
10 lbs. meat meal	9.46	5.40	.70	.34
		12.76	47.44	2.28

The ratio of the starchy (carbohydrates) to the protein (nitrogenous) matter is 1 to 4.1, about the right proportion for laying hens. If anything the proportion of nitrogenous matter is high and it would be possible to cut out 4 or 5 pounds of meat meal, but I would not consider it economy to do so. If corn meal is as high in San Jose as at this point, $2.00 per hundred, I should look about for something equally good for less money. It is excellent in this ratio as it provides fat in larger proportion than barley. The only objection is its cost.

VITALITY.

To my mind the most important problem to-day is for the poultryman to have the ability to renew his flock, writes James Rice of Cornell University. More failures have occurred from that one cause than from all the other causes put together. The failure to renew the flock has been due, of course, to many contributory causes, some of them due to improper housing, some improper methods of

feeding, some improper methods of incubation, and some improper methods of breeding, but I believe that much of the trouble has been due to the lack of appreciation on the part of the person collecting a breeding stock and the importance of choosing fowls of well known vitality. Now the question of selecting for vitality is all the way through the whole history of the fowl from the egg to the baby chick, the chicken partly grown and the fully matured bird.

Begin With the Eggs.

To begin at the beginning the egg should be fully developed and of normal size, laid by a mature fowl of ideal shape and vigor, an egg that is perfect in its shell, shape and size. It is pretty well proveu that eggs that show weakness in any part show that there is a lack of health on the part of the hen. Fat nutriment or some contributory cause produces a weak-shelled egg, and if the shell is weak we have every reason to believe that the inside of the eggs is usually weak, and we would, therefore, get a weak chicken; so that we must begin by selecting the egg if we want a strong chick.

Let Them Alone.

I do not believe we should help chickens out of the shell. I have helped them out and I have seen them grow and overcome their weakness and yet I believe as a matter of policy we have got to fight it at every point. We must kill weakness whenever we see it and we should not undertake to help the little fellows that show weakness. If you can see chickens improperly incubated and perfectly incubated, you will see that some come out covered with good down, large and full of life, squirming and full of vigor, and they have little eyes that stand out like shoe buttons. they are so black and bright, and this is one of the best indications. And they have shanks that are fat and plump as compared with the little shriveled up shanks of the weak ones. They have a beak that is short and thick, and of a good color as compared with a pale beak.

Range.

I believe in the large commercial ranges. We have got to come to the point of eliminating these birds, putting them by themselves beyond any possible chance of ever getting amongst our breeding stock. When they are getting their chick feathers we have another period in their lives when they tend to show their low vitality. We have started a line of investigation at the University that we hope to carry on for a good many years to come. We selected brothers and sisters of White Leghorns hatched in the same machine and in the same process, and yet some of these chicks showed from the very start and continuing right straight through up to the present time, normal, vigorous, healthy; others showing delicacy and low vitality. We went in there and picked out all these low-vitality chickens and marked them, and leg-banded them and numbered them, and we did the same thing with the strong, vigorous chicks. We did not take a chicken that had low vitality that we felt would probably not live, because there would be no use in spoiling our experiment in that way.

Weak Ones Eat More.

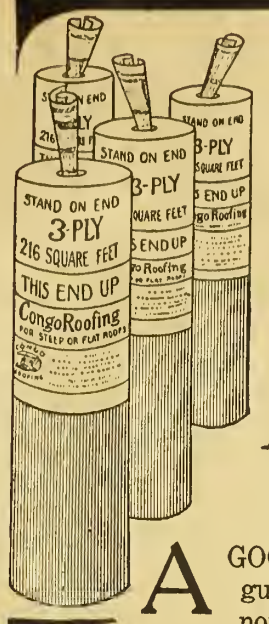
And you can see the difference between these chickens when they weigh two pounds apiece and later when they were put into winter quarters. The time will come when they have reached the limit of their resources, and they will not be able to produce eggs. It will show especially in the moulting time when they are asked to reproduce and put on a new coat of feathers. We have six experiments on the way, two of White Leghorns and one of Barred Plymouth Rocks. The White Leghorns, weak, averaged 2 3-10 pounds, the strong 2 8-10 pounds, almost no difference in size. The total number of eggs laid by twenty-five of weak vitality was 287. The total number of eggs laid by strong vitality 315; value of eggs $9.25 for the weak, $10.40 for the strong. For the second experiment the weak averaged 3 8-10, the strong 3 9-19. The weak laid 198 eggs, the strong 275. The value of the eggs of the weak was $6.36, strong $9.10. The cost of feed for the weak $2.10, the strong $3.18. The strongest contrast is between the Barred Rocks, the twenty-five weak averaged 4 6-10 pounds apiece and the strong 6 3-10 apiece. The cost of feed was $4.20 for the weak and $5.48 for the strong. The weak ate more food in comparison to the value of the eggs they produced than the strong.

In some cases these chickens that were weak have overcome it to such an extent that you would hardly be able to tell them now from the strong: just the same as a child born weak, by being kept under the most favorable conditions overcomes that weakness and eventually grows to be strong. Yet if we know anything about the law of heredity—like producing like—there will always be a tendency of the individual that was once of low vitality to break down or reproduce that weakness.

Pick The Strong.

We then come to the problem of picking out the strong and the weak for breeding purposes, going right into the pen and picking out those fowls that show strong vitality.

I believe that we can pick them out so that when we put them into the breeding pens they will give us strong or low vitality according to the birds we selected. It does not necessarily follow that if we picked out a hen who is now showing low vitality that she would produce chicks of low vitality. I picked out a hen of low vitality, and Professor Graham said, "Don't take her, she is too well known, she has a wonderful record behind her." It is not an indication that that hen has not been a hen of strong vitality. She might be of low vitality because of that heavy egg production. I have seen hens of the strongest possible physical strength, the picture of health, and that had never laid an egg. There was no reason in the



A GUARANTEE BOND

INSIDE EACH ROLL OF

CONGO

NEVER LEAK **ROOFING**

A GOOD many roofings carry guarantees. Most of these are not worth the paper they are written on. They are full of provisos that no one can live up to, ***and you have only the manufacturers' word behind them.***

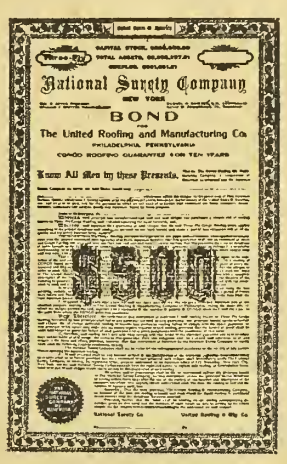
We looked into this proposition some time ago, and determined that we would offer a guarantee with every roll of Congo that would ***mean something.*** We therefore went to the National Surety Company, a corporation with over $2,000,000 of assets, and arranged with it to furnish with every roll of Congo a ***genuine Surety Bond.***

It ***guarantees*** that our three-ply Congo Roofing will last ***ten years,*** if the directions are followed—and the Surety Company stands behind that guarantee to the limit of its resources.

It therefore protects you absolutely. It substitutes absolute knowledge for guesswork.

If we went out of business to-morrow, it would make no difference. The Surety Company is behind us.

We mean to show the public that we have confidence in the ***durability*** of Congo, and that we are willing to back this confidence up in a way that no other manufacturer ever dared to.



National Surety Company
BOND
The United Roofing and Manufacturing Co.
$500

Fac-Simile of Guarantee Bond, on request.

We can afford to make this strong guarantee because we know Congo will last the full period of the guarantee, and more. It has always given better satisfaction and all round service than any other ready roofing made.

This bond is the broadest and most liberal proposition ever offered in the roofing business. It means we have faith in Congo. ***It protects you absolutely.***

If you are looking for a watertight roofing that needs about as little care as a roofing could get along with and give satisfactory service, ***backed by a guarantee that means something,*** Congo is what you want. It is made of the very best materials that can be secured, and is the most pliable waterproof roof-covering on the market.

We do not ask you to take our word for this, but will gladly send you free samples If you have these before you and consider that behind the roofing is not only our reputation but a surety bond, we know that you will not fail to purchase Congo. Write at once and let us send you Samples.

SPECIAL NOTICE — If any Congo rolls that you purchase do ***not*** contain Guarantee Bonds, write us at once, telling us where and from whom they were purchased, and we will at once mail you the missing bonds.

White Wyandottes Exclusively

Good, White, Typical Birds. Stock and Eggs For Sale.
W. A. SEYMOUR, R. F. D. No. 1, Anaheim, Cal.
Take Santa Ana Electric Line to Harper Station

Cover a fresh egg with a thin coating of lard and it will keep perfectly good for an indefinite period, according to a report of a new method of preserving eggs made to the State Department by Consul Murphy at Bordeaux. The discovery is of Italian origin.

Never allow a sick bird to mingle with the rest of the hens.

Old hens should be sold when the breeding season is over.

world why they should not be strong, healthy and vigorous. I maintain that no matter how good a trap nest record you have and great a reproduction power the hen may have, if at the time she produces these eggs she is of low vitality her chicks may be of low vitality. Sometimes the very fact that a hen is the best hen we have got on our place will indicate she is not a good hen to breed from. The best hen we have got on our place at the present time, a hen No. 61, laid 216 eggs in the first ten months of her laying period, she was most vigorous and could give us the most fertile eggs, and the most hatchable eggs out of seventy hens. Her record shows right straight through that she was one of the most reliable hens in the whole place. She had a constitution that would stand up under heavy feeding.

EASY POULTRY KEEPING

That's what we are all after, easier ways of doing things. And its all right, too. In every branch of farming, labor-saving machinery and methods have largely removed the drudgery of other days. What farmer of to-day, with any considerable farm, and making a business of his farming, would think of sowing his grain by hand, cutting his hay with a scythe, his grain with a cradle, raking by hand, or threshing with a flail? He couldn't afford to do so. No more can the poultry farmer afford to follow all the old-time methods if he wishes to do a large business at a profit.

Starting with good incubators, chicks can be hatched by the hundreds with not much more time and labor than by the dozens by the old method. With good brooders, a large number can be cared for as easily as much smaller numbers with the old hens. Then the modern feeding methods insure not only a larger proportion of chicks raised, but raised in such a way that rapid, vigorous, healthy growth is assured, and we have plump broilers, fat and juicy roasters, and pullets ready to lay at a much earlier period than under the old hit-and-miss methods. Many successful feeders now give the feed dry, a mixture of grains so proportioned that the chick gets the right elements in just the right quantities, without the dangers incident to the old sloppy, mussy, wasteful wet feed. In feeding the wet mash, if too much was given, there was danger in the souring of the surplus; if too little, the chicks were stunted. With the dry grain feed there is no danger, for any surplus does not become tainted. So, much less frequent feeding is necessary. Then as they grow, the dry grain or ground feed in hoppers gives a constant supply with a minimum of labor. The only care is to see that they have enough, have clean and well ventilated roosting quarters, protection from storms, pure and abundant water, and a plentiful supply of green feed. They should, too, have shade from the hot sun. Many a chick has died from sunstroke. Few who haven't tried this hopper feeding realize what a great saving and convenience it is. When farm work is pressing, the poultry is often liable to be neglected; but if there is a supply of feed in the hoppers, and water within reach, the birds do not suffer, even though the seedtime and harvest demand the farmer's entire time.

I know of a farm where the poultry is housed in colony houses scattered over cheap land, and these houses are visited just once daily. The floors are covered with litter, and the houses equipped with feed hoppers and water pans. Each evening a wagon carrying dry mash, grain, water and whatever else is needed, is driven around. The grain is scattered in the litter for the next morning's breakfast, the dry mash is put in the hoppers, the water pans are cleaned and refilled, the eggs are gathered, and everything is all right till the next evening.

I knew of another farm, a few years ago, where the scattered colony houses were equipped with large hoppers for holding grain, these being filled once a week right from the wagon that brought the grain to the farm. Numerous springs and brooks supplied pure water, and about the only daily labor was picking up the eggs. The labor problem was about reduced to the minimum. And, after all, the labor is the biggest problem in modern poultry keeping or any other farm operation.

The advantages of dry feeding poultry are not only a saving of labor, but improved condition of the birds with consequent improvement in the hatching qualities of the eggs, which, of course, means stronger chicks and better and stronger breeding stock in the next generation. This is one of the strong points which the advocates of dry feeding have claimed for some time. They insist that a continued improvement can be noted year after year. These things mean much to the poultryman, and are well worth considering by every raiser of poultry, whether it be as a main business or as a side line, which the poultry usually is on the average farm.—Farming.

Whitman county, Washington, reports to the assessor more than $3,000,000 worth of live stock.

Pick out a few chicks and feed them for the early shows.

Old hens are said to make better breeders than pullets.

In cases of sickness in the flock, remove bird affected.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the EGG FOOD during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes COULSON'S IMPROVED MASH EGG FOOD and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Small Fruits and Vegetables

CABBAGE WORMS.

Cabbages are subject to the attacks of several insects, but especially of the green cabbage worm and the cabbage aphis, for which various spraying mixtures are found to be highly efficacious. However, for the man who likes to make his sauerkraut himself, or to grow a few cabbages for his table there is a simple remedy for these insects which involves very little trouble and for which the remedy is always at hand, and here is the story of its discovery.

A carpenter living in a town in New York was very proud of his little back-lot garden. In it he set several rows of fine cabbages one year. These grew well for a time until he was summoned away from home for a few days. Upon his return he went out to the garden and there beheld a sorry sight. The cabbages which had been his especial pride were honeycombed and contained hundreds of these voracious cabbage worms. His anger was frightful to witness, and his language unfit for publication. He dashed into the house to tell his wife what had happened during his absence, and beheld two steaming kettles upon the stove. Grabbing one in each hand he returned to the garden and poured boiling water over every cabbage. Thus his rage was satisfied and the worms punished. The cabbages were a sorry sight, appearing to be pretty thoroughly cooked. But to his great surprise, in the course of a week they began to head up and he had the best cabbages he had ever had.

Briefly, the secret is to pour about a cupful of boiling water into the cabbage just after the inner leaves have begun to curve inward to form the head. The leaves thus cooked dry into a hard exterior, shutting out the worms from the inside and continue to grow into a firm, solid head. —Leslie F. Paull.

THINGS TO REMEMBER IN BERRY GROWING.

Few things give more satisfaction in the garden than a good strawberry patch. And if a few important points are observed, it is easy to have berries in abundance. A successful berry grower says:

A few important things in growing strawberries are, first, to have your ground well prepared. Manure it heavily the year before you set out the plants, and plant it to potatoes or something to cultivate and keep it free from weeds. Second, get varieties that succeed in your soil and climate.

Some varieties are worthless in certain localities. It is best to get plants as near home as possible from some one who has a variety that succeeds in your neighborhood if possible; such plants are worth double the plants you would get from a distance that have been shipped in.

Third, set your plants properly. It is quite a trick, neither too deep nor too shallow, spreading the roots well. Pot grown plants are nice for a beginner to use, but expensive. I always, in setting from my own beds, leave a ball of earth on the roots; these are as good as pot-grown plants. Always set in the spring as early as ground is in condition; cultivate and hoe often.

WEEVILED PEAS.

The pea weevil is a common enemy of both the garden and field crops of peas. The adult insect is an oblong, rusty black beetle, nearly a quarter of an inch in length. There is a mixture of white on the wing covers and a conspicuous white spot on the back a short distance from the head.

There is only one generation each year. The eggs are laid in early summer on the outsides of the pea pods when the young peas are just beginning to grow. They are deep yellow in color and glued fast with a sticky substance, which turns white on drying. When the eggs hatch, the young grubs burrow through the pods and into the peas, where they live and grow until after the pea is ripe for harvest. The presence of the weevils in the peas may be readily detected when the peas are picked for table use by the presence of a dark spot on the surface, as though the pea had been pricked. Before going into the adult stage the grub gnaws a round hole nearly or quite through the skin of the pea, so that it may escape when the proper time arrives. A careful examination of the peas before planting ought to reveal these holes if they are at all numerous.

The grubs change to the full beetle form before fall comes, and most often remain in the pea until after the planting the following spring. When peas are stored, many of the beetles will come out during the fall or winter.

The injury to the pea consists in the loss of nourishment which is stored up for the young vine to start its growth the following spring. Only a little over half of the injured seeds ever grow, and the others are weakly and do not produce a good crop. Weeviled peas should never be planted.

Where peas are permitted to go to seed and gathered for future use, the greatest danger lies in those that shell out and remain on the ground until the following year. The beetles live over in these and are ready for the new planting. The only proper way is to gather the ripe peas before they shell out, and be sure that no peas are left in open packages from which the beetles may escape during the winter.

If freshly picked peas are immersed in water heated at 140 degrees for a few minutes, the young half-grown larvae will be kiled and the peas not injured for planting. They may also be warmed to the same temperature in a gasoline oven, but they must be stirred frequently so that all the peas will be equally heated; otherwise some of the beetles may escape while some of the peas are heated so much that their germinating powers will be injured.

If the peas are found to be weeviled at the time of planting, they may be thrown into a pail of water. The sound seed will sink to the bottom and the weeviled ones float, where they may be skimmed off and destroyed. Burn them or feed them to fowls. Do not throw away or bury.

Where peas are used in large quantities for seed, such as field peas, the weevils may be killed by fumigation with carbon-bi-sulfid. Place the peas in a receptacle which is as nearly air tight as possible and put on top of them some shallow dishes. Pour into these the carbon-bi-sulfid at the rate of half an ounce to each bushel of seed. Close the receptacle and let it remain for an hour or more. The fumes of the gas will kill the weevils. This gas is very explosive and fire of any kind, including pipes and cigars, must be kept away or serious results will follow.—Southern Fruit Grower.

MOVED AND ENLARGED.

The Morris & Snow Seed Company recently incorporated, has moved to new and larger quarters at 425 South Main street, Los Angeles. The former location was 555 South Main street.

The officers of the company are President, O. M. Morris, vice-president B. F. Reichard and secretary and treasurer M. C. Snow. The new and more favorable location will give opportunity for enlargement stock and a much larger business.

Seeds of all kinds, bulbs and plants will be specialties.

Escondido will observe Admission Day as grape day and will use it to call attention to the fact that this prosperous community of San Diego is a grape producer.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Grape Juice.

Please give information as to how to make grape juice out of California grapes.—J. K., Upland.

There are several different ways of preparing grape juice so it will remain sweet or unfermented for an indefinite length of time. To preserve the juice without boiling or by sterilization is more or less complicated although it gives much the nicer flavored product. Description regarding methods of sterilization may be found in Farmers' Bulletin No. 175, which may be had by addressing the Department of Agriculture, Washington, D. C. The simpler method, that of boiling and canning, is as follows:

Wash the grapes and pick from the stems. Put the fruit in the preserving kettle and crush slightly; heat slowly and boil gently for half au hour. Crush the fruit with a wooden spoon. Put a sieve or colander over a large bowl and spread a square of cheese cloth over the sieve. Turn the fruit and juice into the cheese cloth; drain well, then draw the edges of the cheese cloth together and twist hard to press out all the juice possible. Put the strained juice in a clean preserving kettle and on the fire. When it boils up, draw back and skim. Let it boil up again and skim; then add the sugar and stir until dissolved. Boil five minutes, skimming carefully. Fill hot sterilized jars or bottles. Put the jars or bottles in a moderate oven for ten minutes, in pans of boiling water. Have some boiling juice and pour a little of it into the jars as they are taken from the oven; then seal. Place on boards and set aside out of a cold draft. A good proportion of sugar and juice is one gill of sugar to a quart of juice.

Cover Crop.

Wheu is the best time to sow burr clover for a cover crop in this locality? Also tell me what treatment to give almond tree which is about 14 or 15 years old and bears but very little.—Hazelcroft, Glendora.

If you have plenty of water, seed may be sown at once, or at any time for the next month. The treatment for the almond tree is hard to describe, for we fear you will uever secure much return from it. An old orchardist to whom this question was referred only gave the laconic answer, "Dig it up."

Cover Crops for Walnuts.

I have 35 acres of English walnuts near Nipomo. Trees are 17 years old; soil a dark, sandy loam. Have no water for irrigation. yet raise a good average crop. Would it be best to inoculate the seed or may I buy the seed ready inoculated? How close should I plant to the trees?—D. A., Nipomo.

Without doubt the orchard will be benefited by a good growth of cover crop. Having no irrigation water it is yet too early to plant the seed. Knowing your own district, if you are able to estimate about the time of the first rain, it would be well to anticipate it and have the seed iu the ground ready to get the very first moisture possible. The seed does not come ready inoculated but the bacteria may be had of the seed houses in a form simple to use, with full directions accompanying. Where the ground has been given clean culture for the length of time this has, we should judge the cover crop treatment is exactly what it needs to put it in better working condition. A little bone meal or superphosphate applied at the time of the sowing of the seed will probably give a stronger growth to the cover crop and be of more benefit to the trees.

Mange.

Kindly inform me through your columns what will cure the itch or mange in horses. It comes in spots on face, breast, mane, tail and under the belly. Have tried several sheep dips but they give only temporary relief.—H. E. K., Holtville.

Give in feed every alternate day for a week a teaspoonful of a mixture of equal parts of sulphate of antimony and sulphur. At the same time wash affected parts with a solution of creolin and water.

Fumigation for Black Scale.

I have three orange trees which are very bad with black scale. Kindly give me amounts for different ingredieuts used in hydrocyanic fumigation, or any way to get rid of scale. The trees look bad all the time, as if they were in need of water.—Subscriber, Veutura Co.

The manner of fumigation was given in a recent paper, but approximately a good sized dose for your trees is one ounce cyanide to each 100 cubic feet of space under the tent. Of course as you may see in the Cultivator, one ounce cyanide calls for one ounce sulphuric acid aud three ounces water. Unless there are fumigating tents handy or you have some means of securing them, spray with strong soapsuds in which is a little distillate, or with the regular whale oil soap solution, and you will probably perform the work much more easily and nearly as satisfactorily.

Winter Rhubarb.

Please inform me what is the best thing to do with my Crimson Winter rhubarb planted last season? Should stalks be cut? Has made a good growth and I would like to get it in shape for winter cutting.—J. C. S., National City.

The sooner the old leaves are pulled, the sooner will you be able to get the fresh cutting. To secure the best results at this period you will have to irrigate.

Tuberculosis.

How cau we fiud out whether our cow has tuberculosis? She is thin, has slight cough. We would like to feel safe about usiug the milk. If she should have the disease is it best to have her killed? What is the expense of having the test made?—E. A. H., San Dimas.

The test is comparatively simple aud where farmers have joined together to learu the process the university has seut experts to give full explanatiou. This ou condition the information is to be passed on to other farmers. However, where only one or two cows are to be treated, the best method would be to get the nearest veterinarian. The price for testing in Los Angeles is $5.00; if a veterinarian should go from Los Angeles to San Dimas, it would necessitate of course the additional expense. If neighbors could be induced to have several cows tested at one time the additional expense would be comparatively nothing. The only course open in case the test shows the animal to be diseased is to slaughter the animal. We believe there is no known cure.

Anthrax Cure, Mlix Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Tipping Loganberries.

When is the best time to tip loganberries and dewberries? Is it best to shorten them, say to six or seven feet when tipping them, as my vines are so long. What time is best to spray them for white scale and what kind of a spray is best.—Subscriber.

Any time from October 1 to December 1. The shortening should not be done until after the tips have rooted. While it is possible to root the canes at every joint the tips make so much finer plants that it will pay to use them only. The length of cane left after pruning will depend upon the distance apart in the row. Usually four feet is long enough. If they stand more than four feet apart the canes may be longer.

Spray in February or March with kerosene emulsion.—Q. A. L.

Raising Onion Seed.

I wish information about raising Prize Taker onions for seed in the San Joaquin Valley. Would it be a profitable investment? What kind of land is best, and will the largest onions produce more or a better grade of seed than the medium size ones? When should I set them out, and how many will I require to set an acre? Would also like to know something about the harvesting and preparing seed for market.—A Reader.

I would deem it unwise for an inexperienced person to attempt to grow onion seed for market. Reliable seedsmen are very exacting in their contracts for onion seed, and a novice would find, I think, considerable difficulty in effecting a satisfactory sale. If the inquirer really wishes to go into the business, the right way would be to work a year on some of the large seed-growing farms that are well established, and know every detail.

Briefly stated, the onions are grown—say this season, and kept through the winter, and in the spring set out and well cared for during the summer until they go to seed, when the crop is harvested.

It is a business full of details, and must be learned by long experience. To write out these details so as to be of use to your correspondent would require a good-sized pamphlet. It is an interesting work, that of seed growing, but to be successful it must be learned just as any other business is learned.—Q. A. L.

The Salt Air Pavilion, recently completed at Salt Lake City, Utah, is perhaps the largest single structure of its kind under one roof in the United States. The actual amount of roofing required (the roofing being 32 inches wide) was over four miles. The fact that the Pioneer Roll Paper Company of Los Angeles, California, secured the contract, is but another proof that their roofing is all that they claim for it. Rubber Flaxine and Rubber Sanded Roofing are manufactured by the Pioneer Roll Paper Company at its plant in Los Angeles, California. The Pioneer people will be glad to send a copy of their illustrated booklet "Roof Talk" to anyone upon request.

Stauislaus county is to have an extensive exhibit and a special county day at the State Fair.

The Ornamental Garden

ITALIAN GARDENS.

A TYPICAL Italian garden or better, the home grounds of a gentleman of wealth, is usually a plot rectangular in shape, of perhaps ten or fifteen acres, says a writer in the Los Angeles Times. Its length is about twice or three times its breadth. The terraces are uneven in number, three or five, and the street entrance is at the lower level. Wooded land, oftener the stone pine or cypress, is used to make a pleasant break for the eye where the formality of walks and pavements or the brilliant effect of flower beds is too pronounced.

These Italian gardens rarely have a lawn as we know it, simply for the lawn itself; grass is only one detail of the picture. In some of the older grounds there are wide spaces now grass covered, which once served as open-air theaters for athletic sports, but the American lawn is unknown.

Taken altogether they look to us of the new world like stage settings for some opera, and this is in fact pretty much what they were originally. They were designed as a setting for the formal social life of the aristocracy as well as for private pleasure. Many, perhaps most of them, were only summer homes, but in others the house was a permanent palace, imposing and grand. But in all, the effect of statuary and architecture in combination with greenery and flowers was the central thought, and no plant was allowed to take its own free way; trees were clipped into a semblance of any form except their natural one, and flowers and vines were made to produce the effect of outlining some designed shape. Symmetry, ornament and order, never a semblance of nature or accident of growth.

French gardens of the middle ages were very like the Italian gardens, but as time went by they came to differ materially. In the early days, only such space as could be permitted within the moat or garrison was available, but with the possibility of wider stretches of land, came larger ideas, until wide fields and even forests were included. Long avenues were cut through thick woods, and regions many miles in extent were made to subserve to the scheme in view, but, always, their wildness was the one quality that was preserved.

Fountainbleau is an instance of this, all the seemingly wild territory being adjusted with a skill as accurate as that which goes to the making of the Luxembourg gardens.

The Italian people of leisure and wealth retired to their gardens for rest and relaxation, as the modern American goes to his summer cottage; here they walked in the arbors, rested beside the fountains, admired each other's collections of antiquities or what not, and had splendid entertainments. The lords of France were given to the chase and hunt, and distant castles in deep forests or gorges were better suited to their needs. Long vistas and vast levels are the natural outcome of this life.

In the treatment of water, French gardeners are distinguished by massive heights and business, as in Versailles, while in the Italian formal garden the amount of water used in fountains is very small, and a great variety of effects is produced by throwing it up in small jets, pouring it from basin to basin in thin streams, and running it in underground conduits to reappear on a lower terrace in cascades with marble steps and rockeries. Indeed the fountain is often chiefly structural.

The English gardener lays out the grounds around the home of the lord or country gentleman in a manner altogether differing, yet suited to the needs and tastes of the owner, as these are suited to the titled members of French and Italian aristocracy.

There is always evidence of the English love of privacy and seclusion, exemplified in walls and hedges, in massed groups of trees to serve as a drop curtain for various games. Even in a limited space the demand for a kitchen garden is met, and common sense and thrift are in evidence. There are occasional long vistas to give the sense of wideness, size. There are inclosures, whose exits are cunningly screened to afford the element of the unexpected. There are sunken gardens, where one may have the most enjoyable of all views of a small garden, looking down upon it. There are always beautiful lawns and flowers of the sort that one loves to pluck, certainly roses in abundance.

Some one has well said that however much we are refined and cultivated, there is always an underlying savagery which at times demands satisfaction, and to supply this need, one finds a near-by copse, or wild spot, left easy of access over pasture land and along wild hedgerow.

THE CARE OF GOLDFISH.

Goldfish should be kept in a broad mouthed glass vessel— a vessel with straight sides is best—which should always be nearly full of water, says the Chicago News. A few shells and a small quantity of gravel should be put into the vessel. Many persons are in the habit of dropping breadcrumbs in the water for the fish to eat, but that is very bad for them, as the bread soon sours. Regularly prepared fish food may be had, which should be given to them every day or two. It is a good plan, too, to keep a piece of water weed in the jar. It will grow floating on the water and the fish like to nibble at it.

The water should be changed at least twice a week, and it should be siphoned out, not poured. The best way to do is to use a piece of rubber tubing, say eighteen inches long. Put one end into the water and the other end in your mouth. After sucking the water partly up in the tubing, grasp the latter tightly with your thumb and finger, take the end out of your mouth and, still holding it tightly, drop it into the vessel into which the water is to be drained, which should be lower than the fish jar. The water will at once begin to flow and will continue to do so as long as the drain end of the tube is kept lower than the end in the jar.

MILDEW ON ROSES.

To prevent mildew of roses try the following:

Half a bar of ordinary soap dissolved in hot water. Stir in a quarter of a pound of flowers of sulphur, then add five gallons of cold water. Apply with a spray pump, or if care is taken to thoroughly wet the entire plant, an ordinary watering pot may be used. The mixture must be kept well stirred while using.

Sow pansies and stocks in well prepared seed bed out of doors; have soil light and sandy, well pulverized and leveled before seeding. Cover the seed very little and lay burlap right on the ground to keep the soil from breaking and to keep it always moist. As soon as the seeds are up, take the burlap off and shade the ground with a lath or cloth frame for a few days. Seeds sown in boxes in green houses come up all right, but often they damp off and cause a great loss of time and money. Carnations, salvia, Chinese pinks, verbena, petunia, etc., can be sown in the same way. Primula and Cineraria seeds have to be sown in a box filled with very fine screened leafmold and sand, the seeds themselves are barely covered, but the box is covered with a pane of glass. Great care must be taken to wipe off the moisture on the pane of glass, and also to get the little plants used to the open air by gradually taking off the glass. Primula and Cineraria are generally sown in a green house or cold frame.

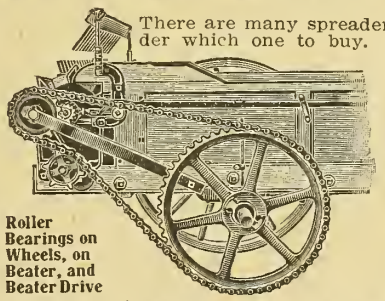
Convinced that humming birds will make good household pets, Miss Gwendolin Brooks will raise them at Central Islip, Long Island. She proposes to sell the tiny birds and already has a lot of commissions for them. In spite of their diminutive size they are not difficult to keep in good health and form a most interesting study Miss Brooks will make a specialty of the species known as the ruby-breasted birds. Their real home is in South America but they have become acclimated to this continent.

Keep the lawn from suffering for want of water. Golden glow is in its glory now; also Golden rod. Keep well watered for large bloom.

Wise economy is needed on the farm. Farmers should grow their own posts, poles, much fuel and material for repairing about the farm. On the prairie farms planting wind breaks points the way out.

Tulare County Agricultural Association is making exceptional efforts to put up a fine county fair this fall.

The One Roller-Bearing Spreader



Roller Bearings on Wheels, on Beater, and Beater Drive

There are many spreaders and so-called spreaders. You may wonder which one to buy. You don't want a machine that you will lay up in the shed for good after a few months. But there's danger of it. We believe we can help you to choose wisely. We have been over all the "features" of all the new spreaders in the 29 years we have been evolving

The SUCCESS

Spreader. It has always been the leading spreader. It was the gold medal machine at Norfolk. It controls patents on the best adapted appliances. It has tried and discarded scores of devices that proved not to be the best. It runs at least a horse lighter than any other spreader.

The Only Completely Roller-Bearing Spreader

It is practically unbreakable. No other spreader is so simple, so direct and positive in its workings, or so easily controlled. We are building for the whole country, and we build it to last—with right care—a farmer's lifetime.

Isn't that your kind of a spreader? Write for catalog and get the proof.

MY CHOICE.

It ain't no use to grumble and complain;
It's jest as cheap and easy to rejoice;
When God sorts out the weather and sends rain,
W'y, rain's my choice.

In this existence, dry and wet
Will overtake the best of men—
Some little skift o' clouds 'll shet
The sun off now and then;
They ain't no sense as I can see,
In mortals sich as you and me,
A'faultin' Nature's wise intents,
And lockin' horns with Providence.

It ain't no use to grumble and complain;
It's jest as cheap and easy to rejoice;
When God sorts out the weather and sends rain,
W'y, rain's my choice.

—James Whitcomb Riley.

A CASE OF STOLEN THUNDER.

BURTON was a lightweight. But, as I learned to my sorrow, this did not prevent women from taking to him. What they saw in him was a mystery. He was neither good looking nor intellectual, nor rich, yet for some reason he pleased the other sex. To be sure, he had good manners and was innocuously pleasant—but then, so many men have good manners and are innocuously pleasant that it can hardly be deemed an asset of great value. He was sentimental! ah, that was it! Assuredly, he understood the art of falling in love, deeply, irretrievably—for the time being. With limits, it mattered little who the woman might be—were Burton's affections nascent, as the chemists put it, they were hers for the asking, or for a glance. It was an imperative need of his nature to be in love. To the unexpected observer there seemed danger of the failure of supply of available spinsters; but Burton's skill in discovering fresh recipients for his regard was equalled only by the inexhaustibility of his affection. Nature had endowed him liberally in this respect.

I had had long experience with Burton as a lover, and I had seen him in the role of songster, horseman and cyclist, according to the demands of the passing courtship; but there remained still one role in which I was to make his acquaintance—that, namely of poet. Unfortunately for myself, I was gifted with a certain facility in rhyming, sufficient to enable me to please myself and occasionally the editor of a minor magazine, but inadequate to more serious purposes. Naturally, my friends were aware of my versifying proclivities—what poet's friends are not?—and among these was Burton. I was, therefore, not surprised by his initial remark one Sunday morning when he had looked me up at breakfast—"You write verse sometimes, don't you, Fahnestock?"

"Oh, yes, occasionally," I said "When the humor strikes me."

"I see—humph! Well how does the humor strike you now?"

"Now?" I cried. "Why, man, I could not write a verse now to save my soul. Why do you ask me?"

"We-ell," he replied, avoiding my eye, "you see, I'm—I'm"

"Yes, you're—you're what?"

"Well, to tell the truth, Fahnestock, I've been trying to write a poem myself, but somehow it doesn't go quite right. I'm afraid I've lost the hang of it."

"Oh, I see! there's a woman in the case, is there?"

"A queen, Fahnestock, a queen!"

"Humph! I've heard of queens before. However, let me see the poem."

Nervously he fumbled at his pocket, from which at last he extracted a sheet of carefully folded foolscap paper, which he held out to me.

"I'm afraid—you know—it's a little bit incomplete still," he stammered, blushing, "but it'll give you an idea."

"Yes," I said, "it'll give me an idea."

Thereupon I unfolded the paper and spread it out before me.

" 'Seeking, humph! I've seen worse titles. 'The breeze for the rose is sighing—gold is her hair and her eyes are brown'—That's all right, Burton, and no doubt strictly true, but unfortunately the meter's a trifle variable; and, you know, there's foolish prejudice against a too frequent change of meter."

"Yes, I know," said my visitor; "that's the reason I came to you."

"Oh, I see—you want me to whip it into shape for you; is that it?"

Eagerly he nodded.

"And you say she's a queen?"

"Fahnestock, she's the one woman in the whole world; she is without a peer; there has never been anybody like her and there never will be, she—"

"Whoa!" I cried, "go lightly! Remember Genevieve."

"Fahnestock!" he cried, reproachfully, "I thought you incapable of such a thing!"

"Well, so I am in general, but acute attacks require heroic measures. But to come back to the poem; what is it, exactly, that you want me to do?"

"I want you to take it, old man, and get the meter right and the rhymes and the rest of it—just touch it up a little—and then—"

"And then you'll send it to her as your own—eh?"

He nodded.

"Burton," I said, sternly, "this is forgery, swindling, obtaining affection under false pretenses. I ought not to abet you in such nefarious undertakings—but give it here; I suppose I've got to do it for you."

"Oh, Fahnestock," he began, "I shall never forget this! You are my friend forever—"

"Give me the poem," I said, dryly, "and go into the other room while I try to whip it into some sort of shape."

In this I succeeded better than might have been expected. Indeed, "Seeking" turned out in the end to be a far better poem than many that I have had printed; it was instinct with passion. This may seem strange, but the explanation is simple enough—while writing I called up before my mind the face of her to whom I fain would have had the right to indite such words, the face of Madeline Carter, whose very name had power to thrill me, and without whose smile life held but faint charm. And, lo! when I thought of her the words flowed from my pen as though I, too, had been born in Arcady.

Was it to be wondered at, then, that Burton was delighted with my effort, and departed with protestations of eternal gratitude? I smiled as I saw him hastening down the street, impatient to reach home and copy the verses and send them off to his lady love as the product of his own brain. Madeline Carter—Francis Burton! Could there be a more incongruous pairing? Burton, light, flippant, inconsistent; and Madeline, calm, true and unchanging. It seemed almost a desecration to her to associate them together even in one's mind. I could picture to myself the style of girl who had captured Burton's heart, and smiled in thought of the superiority of my choice.

My own love affair quickly came to

FARMERS' BOOKS
Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A, B, C, AND X, Y, Z, OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

a climax, and alas! to an unsatisfactory climax. Madeline had come on to New York for a visit, and I lost no time in pressing my suit. For a while she seemed to hesitate, then one unhappy evening she gave me her answer and my house of cards lay in ruin at my feet.

"I am sorry, Mr. Fahnestock, very sorry, she said, in that gentle manner in which good women inflict unavoidable pain, "but what you ask is impossible—I have already given my heart."

"Oh!" I cried, "then, of course, there is nothing more to say," and I arose and moved to the window.

"Don't you care to know to whom I am engaged?" she asked.

"Yes, if you care to tell me."

"To a Mr. Burton of Virginia."

What!" I cried. "What Burton?—not Francis?"

"Why, yes, do you know him?"

"Do I know him?" I groaned; "do I know him? Lord, this is awful! You wouldn't marry that man?"

"Mr. Fahnestock!" she cried, and every drop of blood left her face, "you forget yourself! Do you realize what you are saying?"

"For a moment we stood looking fixedly into each other's eyes. Then my sanity returned and I bowed my head.

"You are right, Miss Carter," I said, "I did forget myself. I was mad with disappointment. Please attribute it to that. It shall never occur again.

Therewith I got out of her presence as quickly and gracefully as I could, and hastened into the silent night to be let alone with my grief. Madeline Carter to marry Francis Burton! It seemed like a monstrous joke. And I had not even known of their acquaintance!

Madeline was too gentle and forgiving to treasure up my outbreak against me, and when my wound had healed, at least superficially, we drifted into a state of friendship which to the eyes of strangers was founded on a mutual regard as platonic as it was sincere. Not only that, but on the occasion of her marriage with Burton, which occured in New York, I served in the capacity of "best" man, and at the breakfast afterward it was my voice which brought out the toast to the newly wedded pair. And later, after she and her husband returned from their wedding trip and settled down into the steady course of married life, I gradually came to hold the position of a friend of the family who is always welcome and adapted to the role of confidant. Burton was still the same superficial, light-brained butterfly that he had always been, although I must do him the justice to say that his devotion to his wife was exemplary. That is, it would have seemed exemplary had it not been rewarded by a devotion so much greater and deeper that it shrank into insignificance. Madeline's admiration for her husband was boundless. She never wearied of talking about him. In her eyes he possessed all the virtues and talents, and if the world did not reward these as they deserved, it was solely because the world was not run on principles of justice. It was touching.

"I only wish he could take up his writing again," she said to me one evening when we were alone, during Burton's absence at the office. "I am sure he has great talent for it."

"Oh, is that so?" I replied, wondering whence she had derived this fond conceit.

"Yes, he can write most beautifully if he only has a mind to, especially poetry. One thing he wrote me before our engagement is exquisite. Wait a moment and I'll show you."

Without waiting for my reply she ran across the room to her desk and took out a paper from one of the pigeonholes. This she unfolded and handed to me.

"There, see, if you don't think that beautiful."

With a premonition of the truth I cast my eyes on the paper. "Seeking"—it was my poem which had come back to me after many days! Silently I read the familiar lines, and then returned the paper to her.

"Yes," I said, "it is charming. Only a man who loved you very deeply could have written that."

"Yes," she said, "I knew you would appreciate it."—William Wallace Whitelock, in the Reader.

RECIPES.

Dill Pickles from Fresh Stock.

Dill pickles from fresh cucumbers are of high quality, but not quite as satisfactory keepers as when made from salt stock. In preparing fresh stock for dill purposes, fresh cucumbers as they come from the field are placed in casks from which one head has been removed. A layer of pickled dill and one quart of dill spice is placed at the bottom of the barrel. The cucumbers should be assorted carefully as to size, one grade of about four inches in length being placed in one receptacle and another grade of five inches in length, or approximately this length, in another barrel. After a cask has been filled, a layer of dill is placed over the fruits before the head is replaced. After the cask has been reheaded, the commercial practice is to remove the bung and fill the cask containing cucumbers with a 45-degree Baume test brine, adding one pound of porous alum to each 45 gallons of brine. The cucumbers are left in this brine five days. The first brine is then replaced by a thirty-degree brine, to each 40 gallons of which one-half pound of porous alum and four gallons of 80-grain vinegar are added, the whole heated to 160 degrees F. before being placed in casks.

Dill Pickles From Salt Stock.

To make dill pickles from salt stock, the cucumbers are removed from the brine, placed in a tank and covered with fresh cold water, and are allowed to remain for twenty-four hours, after which the water is drawn off. The tank is then again filled with fresh water, to which is added two pounds of alum and two ounces of turmeric to each barrel of pickles in the tank. The whole mass is then heated up slowly to 130 degrees F. The fruits are allowed to stand in this cooling mixture for twelve hours, when they are sorted and packed.

Before beginning to fill the cask with cucumbers, place a layer of pickled dill herb at the bottom of the cask, fill the cask half full of processed cucumbers, and add another layer of dill herb, at the same time placing in the cask one quart of dill spice, consisting of the following proportions of whole spices: 4 pounds of allspice, 2 pounds of crushed black pepper, 4 pounds of coriander seed, and 1 pound of bay leaves. After adding this spice and the layer of dill herb, complete the filling of the cask, but before replacing the head of the cask scatter another layer of dill herb over the cucumbers. After being reheaded, the bung is removed and the cask filled with dill brine consisting of one-fourth barrel of dill herb, 1½ pounds of alum, and 100 gallons of 30-degree brine. At the time of filling the barrel 1 gallon of 50-grain vinegar is added to each 10 gallons of the brine. This brine should be allowed to stand twenty-four hours before using it to cover the processed cucumbers packed in barrels as above described.

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Exclusively a Savings Bank whose policy is for ***Conservatism*** and ***Safety,*** the result of ***50 years experience.***

Deposits may be made and withdrawn by mail.

San Francisco Savings Union

Founded June 18, 1862 Northwest Cor. California and Montgomery Sts., San Francisco

Conducts a Savings Bank Business Exclusively

Capital Paid Up, $1,000,000.00. Surplus, $1,183,632.00.

Total Assets, $27,508,850.00.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Sept. 2, 1908.

Butter.

An advance of 2½ cents is noted in extras and a firmer tone prevails in the butter market. Receipts are normal and nothing of special note appears in general conditions. Sales of ex creamery are made 2½c in advance of quotations.

Wholesale quotations now are:

Creamery ex per roll..............57½
Firsts.... 55
Dairy.... 25
Cooking...... ....23½
Butterine"...... .. ..15@20

Cheese.

Southern California...... .....16@16½
Northern fresh... 14
Longhorn...... ....17@18
Eastern singles.... ....15¾@16¼
Cheddars... ... .17
Imported Swiss...... ....28@28½
Swiss....... ....17½
Oregon........ 15
Limburger...... 18

Eggs and Poultry.

An effort to beat down egg quotations has been made but light receipts has held materially same quotations as a week ago. In fact, bringing price of case count was beaten down 1½c one day last week but quickly recovered.

Eggs local candled..................35
Eggs case count 30
Firsts fresh...... 33
Eastern fresh...... ....25@26
Eastern fresh jobbing price....23@26
Storage...... 26

Poultry is showing more interest and a slight advance in quotations is observed.

Wholesale prices..

Lambs per head...... ......3.00@3.25
Wethers.. .... .4.00@4.50

Potatoes.

A material advance in quotations on potatoes has been made during the week and the strong bear movement seems to have collapsed. The large dealer who had attempted to bear the market failed to deliver his large sales offered at ruinously low prices, which showed the trade that conditions were not what they seemed, hence a strong advance.

Wholesale prices are:

Sweet potatoes per ctl........1.75@2.00
Burbanks choice.... ....25@75

Hay.

Somers & Co. say:

There has been a material increase in hay arrivals during the past week, the total showing 4350 ton in comparison with 3180. Owing to the peculiar sensitiveness of the market, the situation is very weak at the present writing with prices back to the range which was quoted about two weeks ago. Although it is generally reported that a car scarcity exists throughout the State, yet for some reason hay shippers in most districts have been quite successful in supplying their wants, for 100 cars more than last week were supplied for hay at various points during the week ending today.

Buying prices are:

Choice wheat hay..........16.00@17.00
Good wheat hay...... ....14.00@15.50

Middlings.... ....32.00@35.00

Ventura county bean farmers are investing each day in bean-threshing outfits. Some farmers with average crops last year lost enough on their beans to nearly purchase the entire outfit. It will probably result in less work being done by the regular thresing outfits.

Citrus Market

LOS ANGELES, Sept. 2, 1908.

Valencias are not meeting with the ready sale wished for and the tone of the market is decidedly off. This has been partly on account of the weather and the quantity of deciduous fruits in market. There yet remains in the market less than 300 cars of Valencias to forward so that should low prices prevail from now on it will affect but a small proportion of the total.

Lemons are not strong in tone but with the small receipts of foreigns now being made it is probable that a fair price may continue.

Shipments.

Total shipments of citrus fruits since Nov. 1, 28, 339, of which 4390 were lemons. To same date last season 26,879, of which 3193 were lemons.

NEW YORK, Aug. 28.—Two cars Valencias and one mixed car of California citrus fruit sold. The market is firm on good stock. Weather is clear and cool.

CLIP YOUR HORSES.

One of the greatest improvements ever introduced into stable management, acocrding to the opinions of leading veterinarians, is the custom of clipping horses which has now become so common. A clipped horse will not only do a greater amount of work on the same amount of food than a horse with his natural coat will do, but he will also be fresh and full of vigor, while the horse with the heavy coat will be dull, out of condition and seldom or never clean or dry. Clipping removes the tendency to sweat, and

FLIRTING WITH THE "HIRED MAN."

there is no comparison as between a long, wet coat and a short dry one. When the long coat is warmed up and the horse is being worked regularly it is next to impossible to thoroughly dry the coat and this causes the animal to lose flesh, in addition to making him a prey to a multitude of ills. Big companies which require hundreds of horses in carrying on their business, have experimented and have found that where their horses were clipped coughs and pneumonia have been practically eliminated. Clip your horses in season if you want to keep them healthy and in good condition.

You can make money by saving money, and you are surely ahead of the game when you can purchase a good clipping machine for less than nine dollars as advertised in this paper, and save wearing out your horses and get work from them that otherwise could not be got on account of their condition.

Keep your horses in condition by clipping them. They need to be clipped even more than they need to be shod. Shoeing them makes them comfortable in their feet. Clipping them makes them comfortable in body, and more, it makes them healthy and vigorous. The clipped horse feels better, works with spirit and gets there. It's to your benefit, means money in your pocket and satisfaction to your feelings.

Health and appearance add value to your horses—clipping makes them healthy by taking off the heavy coat of hair that mats with sweat and lies tight against the skin, covering up the pores and preventing healthy action in the sweat glands, causing irritation and finally sores and other skin disorders. Then, too, after a horse has worked himself into a sweat, or is wet from the rain, he is led into the barn where he remains in the chill night air subject to colds, rheumatism and fevers, because the natural heat of the body cannot find its way through the matted coat to thoroughly dry it out. When the horse is clipped the hair is short and free and is quickly dried out by the natural heat given off by the body, and averts all tendencies towards disease.

Clipping makes your horses look better. This is evident. You know that if you had the choice between a dispirited, shaggy-haired nag and a smooth, shiny-coated spanker you would pick the latter. What makes him look like that is a clipping, which takes away the bunches of dead hair, and makes cuffing a snap.

Furthermore, the half hour you give to each horse in clipping him early saves you three-fourths of the work of cuffing and taking care of him the rest of the season. No long hair sticking in your curry comb and brush. No going over the horse a half dozen times to get all the loose, long hair off. No shedding of hair for a whole season to have them blow over everybody and everything.

The Sonoma County Co-operative Poultry Association has been engaged for some time in shipping eggs, but made its first shipment of poultry last week.

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

Make $2,000 a Year Raising Sugar Beets

WE have claimed and have proved to a great many buyers that our land at Corcoran, was as GOOD as the BEST in the world for Sugar beets. Here is proof:

Mr. T. H. Schultz, 460 West Sixth Street, Long Beach, Cal., is known all over Southern California as one of the most successful Sugar Beet growers in California. Mr. Schultz went to Corcoran and thoroughly investigated our land, and so well was he satisfied that he bought a large tract and this year will plant the same to Sugar Beets. Mr. Schultz says:

"After a most careful investigation of the soil, climate conditions, water supply, etc., I am satisfied that I can not do better than to add a large tract of land in Corcoran, on the Pacific Farms Tract of land in Corcoran, to my holdings, and have done so, and I recommend this land to any buyer for sugar beet raising or for onion growing."

NOW doesn't it stand to reason that if our land is good enough for "experts" it is good enough for those just starting in—and is it not a wise move to be a near neighbor to those who know how?

YOU can make a success by going into the sugar beet raising industry, and you will make a success of it on our land.

PRICE of our land is $100 per acre, on easy terms. This price includes the water developed, the ditches made and the roads built, so that your tract fronts on a good road. Call or write for "Profitable Realty," our magazine which tells how to get an income for ilfe in California.

Two Cultivator Representatives at the State Fair

Details of Some of the Exhibits

By M. C. Holman of San Francisco

THE Fifty-fifth Annual State Fair was bigger, better and more interesting than ever before. There were more than 1000 exhibitors, including counties, cities, associations and private firms and individuals. Every inch of space in the great pavilion was taken long before all of the exhibitors had called for room and a portion of the surrounding lawn was fenced in to give a place to delinquent applicants. Secretary Filcher, in his remarks upon the work, said: "This fair stands at the head of the list. We have more counties represented, more new features and a greater number of exhibitors than ever before."

The formal opening of the fair occurred at eight o'clock on Saturday, August 29, and presented one of the most beautiful, patriotic and impressive ceremonies ever witnessed. The inside of the pavilion was a maze of beauty. Countless flags, emblems, ribbons, and yards of bunting combined to make a sea of many colors. At the word of command picked men from three companies of the National Guard of California stood at attention. A few remarks by the president, Mr. Rush, were followed by the band playing The Star Spangled Banner. With uncovered heads the visitors watched the great American flag drawn to the rafters, and the fair was well under way.

The pavilion was a hall of wonder and a joy forever. No one could carefully examine the splendid displays without being refreshed in body and strengthened in mind. As an educational factor the fair stands well forward as a state effort. So many and varied were the exhibits that space will not permit us to mention all. Some of the more important ones may be specially noted.

There were sixteen counties showing the best from their gardens, fields and orchards. Each exhibition was tastefully arranged and gave an idea of what is possible in agricultural lines.

The folowing were some of the more important exhibitors:

Bowman Carriage Company. Two sections; carriages, wagons and farm implements. This firm was completely burned out on the day previous to the opening, but managed to save enough vehicles to make an excellent showing.

A. Meister & Son. Buggies and wagons.

Alameda Rug Works. Complete line of California made rugs.

A. S. Hopkins Co. Broom factory in operation. This was one of the principal centers of attraction.

Santa Rosa Shoe Company. Their product compares favorably with eastern made shoes.

Pacific Knitting Mills. Sweaters, jerseys, underwear, etc.

Thomas Lewis. Fertilizer. Good exhibit showing the effect of using his particular preparation.

G. C. Roeding. "First Run" olive oil. Exceptionally fine exhibit, showing a clear, absolutely pure oil.

Burbank's spineless cactus was an interesting feature of the Santa Rosa exhibit.

Breuner's House Furnishing Company. Complete exhibit. A very attractive spot and much admired.

Walsh-Richardson Company. Full line of harness and saddles.

G. H. Waters, Pomona. Canned goods.

Sylmar Olive Oil. Attractive display of the association's famous product.

C. H. Wagner, Pasadena. Exhibit of rhubarb showing many varieties and the development of the plant. Prize stalks measure more than thirty-three inches long. Mr. Wagner is now experimenting upon medicinal rhubarb, the seed of which is obtained for him by the government from the center of China.

Pioneer Roll Paper Co., Los Angeles. Interesting exhibit, showing the application of their roofing paper to all classes of buildings.

Separators. The United States, International and Sharples companies made very creditable showings.

Standard Oil Company. Harness dressing, axle grease, hoof oil.

The agricultural division of the University of California exhibited an excellent assortment of grasses, grapes, plants and fifty varieties of grain. In conjunction with this was the exhibit of the State Board of Animal Industry, showing various germs which affect domestic animals.

The Central California Land Agency of Turlock presented in miniature the Turlock irrigation district. A dam over which flowed a bountiful supply of water made an exceptionally interesting feature. Adjoining this was a view of the fertile valley with samples of fruit and vegetables raised there.

Educational Features.

This part of the fair was given special attention with the result that many institutions of learning made excellent showings.

The work done by blind children of the state institution made a favorable impression. They make hammocks, brooms, mattresses, etc.

Capital City Commercial College. Complete exhibit, showing artistic penmanship, text books, methods, forms, etc. This is one of the most thorough schools on the coast.

Howe's Academy displayed some exceptionally creditable work.

Besides these special exhibitors there were shown embroideries, art work, wood carving and hundreds of other skilled products.

Machinery Hall.

Adjoining the main pavilion was the space given to pumps, engines, and kindred subjects. This was one of the most interesting portions of the fair and attracted thousands of visitors who found much to instruct and entertain them. Nearly all of the machinery was in motion and the pumps were kept constantly working. A great central tank holding about 50,000 gallons of water was the source of supply. Shooting in every direction were various sized streams, making a veritable fountain.

Among the most important exhibitors in Machinery Hall may be mentioned:

Western Gas Engine Company. Splendid showing of the "Western" engine and hoisting machinery.

Byron Jackson Machine Works. Famous deep well pump in operation. Large and small engines and pumps.

Samson Gas Engine Company. Excellent exhibit of gasoline and distillate engines.

Standard Gas Engine Comany. Complete line of "Standard Engines."

G. W. Price Pump Company. Exhibit of 24-inch pump having a capacity of 35,000 gallons a minute. Pumps in operation.

Arthur Koppel. Ranch railways and cars. Very interesting exhibit of labor saving conveyances.

Department Farm Implements.

Almost every kind of farm implement was on exhibition. Among those making specially attractive displays were:

Junior Monarch Hay Press Company, John Deere Plow Company, Earth Boring Machine Company, Henshaw Buckley Company, and Herron, Rickard & McCone.

Live Stock.

The second division of the fair was that of live stock. Situated at a distance of about three miles from the pavilion is the race track and within its high walls were gathered the choicest of the choice in animal breeding. What this portion lacked in quantity it more than made up in quality and the statements of several of the judges testified to the high grade showing. All available space was taken and more was called for. Every fancier brought his choicest offering to be placed upon the scale of critical and scientific judgment. It was truly a magnificent display of blooded stock.

The opening of this portion of the fair occurred on the afternoon of August 29th, and consisted of races, leaping the gap in an automobile by "Dare Devil" Breton, and showing of the stock.

A more dignified opening occurred on Sunday when the equine parade attracted thousands of people. It consisted of beautifully decorated carriages, which followed closely the lead of a six-horse tally-ho, in which were seated about thirty of the fairest daughters of California, each carrying a beautiful white parasol.

The blooded horses followed the carriages and presented a pleasing picture by their spirited movements of life and energy.

Among the exhibitors of Berkshire hogs we specially mention the following: G. A. Murphy of Perkins, Carroll Cook of San Francisco, and the estate of the late Thomas Waite of Perkins. Mr. Murphy showed the largest boar at the fair. It weighed slightly under 1,000 pounds, girth 6 feet 8 inches; length 5½ feet.

Poland China hogs were exhibited by G. A. Murphy of Perkins, T. A. McCaslin of Sacramento, T. B. Gibson of Woodland and M. Bassett of Hanford. Their selections were so nearly perfect that it was difficult for the judges to place the prizes, a very small feature often determining an award.

Continued on page 263.

Last Fair in the Old Pavilion

By John Isaac of Sacramento

THE State Agricultural Fair at Sacramento has been one of the largest and best attended ever held there. It was asserted when the present management took charge and undertook its reform that no state fair, at least no California state fair, could succeed without the aid of gamblers, touts and sure-thing men. It was at that time as near moribund as it could well be and stil live, and it was determined to make the experiment and at least let it die decent. The old state fair had degenerated into a mere horse show and a series of running events. The agriculturists, in whose interests it was supposed to be run, were conspicuous by their absence and the whole affair had fallen into disrepute.

Under the new regime, gambling was abolished as a feature of the fair, an effort was made to restore its prestige as a state institution, but most of the counties fought shy of it, and it was a difficult operation to get up a good fair, but it was done. The second year was better and this year we have had the best fair ever held in the State.. On the opening night there were 3500 people at the pavilion and this number increased every night until that large structure would hardly accomodate the people.

The Counties Were there.

Among the counties which were prominent in the pavilion Los Angeles held front place, and

POULTRY MANURE.

THERE is a common belief that poultry manure is worth more or at least as much as a good commercial fertilizer. We have been asked if it is as good as commercial fertilizer, best method of applying to orange trees, and how it will do to mix with stable manure.

Analyses show that on an average, fresh poultry manure contains .05 of a pound of phosphoric acid, .56 of a pound of potash and 1.10 pounds of nitrogen to every 100 pounds. According to prices one year with another, this material is worth about $5 per ton, not a very high grade material when compared with commercial fertilizer. It is, however, one of the valuable farm by-products and is well worthy of the best care.

This manure is most economically applied in the irrigation water, because poultry manure contains a large amount of silica in solution and when it dries, it solidifies and imprisons the fertilizing ingredients so that they are not soluble in water and, therefore, not readily available. If put into the soil with water, the fertilizing elements are washed into the soil and remain in contact with the damp earth and are taken up with the soil moisture until such time as they are assimilated by the roots. In this way, the fertilizer elements cannot be wholly tied up by the solidifying silica. These ideas suggest that the proper care of poultry manure consists chiefly in keeping it moist until it is put into the irrigation water.

The reason why hen manure contains so much silica is because fowls swallow so much gravel, sand and even glass to aid in grinding their food. They swallow a set of false teeth with every meal. An examination of the glass which they swallow will show that where there were once sharp edges, there will be smooth surfaces. Most of this goes into solution and solidifies again when the droppings dry, thus encasing a great deal of the fertilizer elements.

Poultry droppings and stable manure cannot be economically mixed for two reasons. The most economical way to keep stable manure is to dry it as fast as it is made. It would not be profitable to mix the other with if you did that. If you keep the stable manure damp or wet till it is spread out the hen manure would keep all right until then, but it is not practical to apply the stable manure in the same way as we advise putting on the other, and so auother difficulty would arise then.

The values above, of course, are not in all cases true and not constant because the food given any animal will have an influence on the contents of the manure.

Fed on grass aud a graiu ration, the manure will not be as rich in ui trogen as if alfalfa were substituted for the grass. The values given above are figured on six cents per pound for potash and phosphoric acid and nitrogen at sixteen cents per pound.—J. W. Mills.

The high prices received from navels packed by C. E. Rumsey and L. V. Brown at Redlands is proof of the worth of greatest care in packing and will probably be an inducemeut to other packing-houses to better their methods.

FERTILIZER SUGGESTIONS.

A writer in the Escondido Times in replying to a former article in which it had been suggested to fertilize citrus orchards with complete commercial fertilizer, gives a few suggestions which have value. He suggests that the plan be amended by advising the farmer or orange grower to grow leguminous cover crops, supplemented with say, for California worn soils, 600 pounds per acre of an acid phosphate to analyze 18 per cent available phosphoric acid, broadcasted or drilled in at the time of sowing the seed for the cover crop, which should be done immediately after the first fall rain comes, but leave furrows for further irrigating, should that become necessary.

He then adds: "During the early spring, before the rains cease, plow under your cover crop six inches deep, and this mass of vegetable matter will soon begin to decay and form humus in your soil, and the vegetable acid produced by this decaying crop will, to a certain extent, become a soil solvent and render locked-up plant foods more available. We would not supply potash to the orchard soils here until the cover crop and phosphates have been given a thorough trial, because most soils contain this element of plant food in sufficient quantity and which becomes more available with the use of the nitrogenous cover crops, phosphates and good tillage.

"We would thus avoid paying out good money for one of the necessary plant foods (potash) until practically demonstrated that it is needed. Nor would we put a single dollar in any chemical to furnish nitrogen or ammonia. Nitrogen is the most expensive of all the plant foods when bought, yet the least expensive when taken from the atmosphere through a nitrogenous cover crop of Canada peas, vetch or burr clover; therefore we say avoid buying mixed commercial fertilizers, and put your money into only such of the chemicals as experimenting will soon demonstrate that your land needs. Ranchers should club together and buy in car lots. An acid phosphate to analyze 18 per cent available phosphoric acid can be bought f. o. b. Escondido for $25 to $27 per ton in twenty-ton lots.

"Now as to the economy of this system of manuring your land let's figure an example of cost per acre. Say you use 600 pounds acid phosphate 18 per cent at $1.35; $8.10. Cover crop seed per acre from $1 to $2.50. Ten dollars and sixty cents expense. If you must supply potash also, then add $3.50 for 100 pounds of sulphate of potash for each acre, and the cost will be but $14.10, or about 20 cents per tree for oranges or lemons. An increased production of fifteen pounds of a better grade of fruit per tree will repay the expenditure. Such a system of yearly fertilization, varying the amount of phosphates and potash as experience will suggest, should produce large crops and make our orchards equal to the best. The use of the cow pea as a soil renovator in the southern states has given wonderful results, and a field of this legume has rightfully been named the poor man's bank. The cool nights of California makes its use here impracticable, but the Canada pea, which does well, is also a good nitrogen gatherer.

"What we have written applies only to an economic method of restoring

or adding fertility to the soil, as our experience as a citrus fruit grower is limited—not yet being out of the a b c class—and we leave the many other things requisite to the successful growing of citrus fruits to be told by the captain and others who have the inclination and a larger experience."

THE SAPOTA.

Our friend, C. P. Taft, of Orange, who has manifested great interest in introducing and testing new varieties of tropical and semi-tropical fruit, recently brought the office specimens of the Sapota, which has fruited on his place in Orange county. It is hard to describe this fruit, but as a rule those who test it are much pleased with its flavor and texture. It is not exactly like the Cherimoya or custard apple, although in the texture of the flesh of the fruit it is somewhat similar. There are several trees in Southern California and all of them show certain variations in the shape and appearance of the fruit. Whether the more desirable varieties may be reproduced by budding or grafting has not been tested. Regarding this fruit Mr. Taft says: "Of the other fruits experimented with, the white Saptota (Zapote blanco), a Mexican introduction, bears very well. The tree is an exceedingly rapid grower, much after the habit of the walnut, but evergreen. In August and September the peach-like fruit, greenish yellow, with large seeds shaped like those of an orange, matures well and is excellent, this being the normal season for ripening. At other times fruit if found is apt to be worthless and even dangerous. It is not ready to eat until quite soft but can be picked hard and ripened off the trees and so readily sent to market. The fact should be here stated that as all Sapotas so far as grown are from seed, there exist the usual variations characteristic of seedlings as to size, shape and flavor, resulting sometimes in bitter or worthless fruit."

SUIT OVER ORANGE BOXES.

Some months ago the California Pine Box & Lumber Co. began suit against the California Fruit Growers' Exchange of Los Angeles to secure $70,000 due on account. A few days ago the exchange filed a cross-complaint in the superior court demanding judgment for $110,692.04, or twice the amount of the claim it holds against the lumber company on account of the overcharge for shook and loading strips furnished under a contract made in September, 1907. The extra $55,000 is demanded as damages.

It is set up in the cross-complaint that the exchange, under contract of last September, was to receive, as required, shook and loading strips for 1,500,000 boxes, at prices ranging from 14¼ cents to 16½ cents each, according to the brand. A further clause, it is claimed, provided that the exchange was to receive the benefit of any reduction in price that might be granted by the lumber manufacturers in the life of the contract.

In June of this year, it is alleged, the price to certain consumers was reduced to 12¼ and 14 cents each. The difference between the agreed price and the lowered price, or an average of about 2 cents a box, is demanded.—California Fruit Grower.

Geological Survey has a force of men working through the Santa Clara and Salinas valleys.

ORANGE CROP WILL BE GOOD.

Reports from all parts of the citrus belt of which this city is the center, are very flattering and the indications are that the crop this year will be fully as good as that for the season which has just passed.

Calamity reports, as is usual with all industries, were sent out early in the season, the wail being that the fruit was dropping off the trees badly, to be followed with a second report that the thrips was getting in its deadly work, and that large areas of trees were being ruined. The visit of the entomologists of the State Department had the effect of nullifying this latter rumor, since although there is no doubt but that there are some of the flies in the orchards here, they have not as yet done any damage to amount to anything and those who are studying the problem affect to believe that climatic conditions are such here that it will never obtain any very large foothold.

Lindsay district is the first to be in with a report as to good crop outlook for the year, an article in the current number of the Gazette stating that the growers in that section were vastly encouraged and that the crop there this year would undoubtedly be the equal of that of last season.

Growers about Plano are particularly enthusiastic and the crop in that portion of the belt, it is stated, will be the best for years, according to the present outlook. Globe growers are finding their trees in good shape, and Zante fruit men are also feeling good over the outlook.

The present season, from all indications now, bids fair to be one of the most successful in the history of the industry in this section. All of the association packing houses in this immediate section are adding new machinery, the very latest methods of packing and handling are to be used, and no new thing will be left undone which will be the means of realizing a little better price for the crop.

At the headquarters of the exchange it is stated that before the season pack starts more than 65 per cent. of the crop will be in the hands of the exchange, which means that the prices will be maintained to the highest point that is consistent with the market conditions.

Many orchards report that the crop will be especially large, some asserting that the yield in their groves will exceed that of last season by as high as 50 per cent. These figures are, of course, for individual orchards, as there are some holdings where the crop probably will be little better than normal. This condition is not one to alarm the experienced ones from a standpoint of over-production since it has almost invariably been the case that when the crop has shown a decided increase in amount the fruit has graded smaller and did not affect the gross number of boxes in the same proportion. Weather conditions for this year have been good, however, and the fruit has been filling up well and will grade better for size in a good many cases than it did last year. Those studying the problem believe the crop, color and the flavor will excel, and if there should come a few days of cold weather just before the Thanksgiving season, the weather conditions for the crop will have been almost ideal for the year.

One thing that the growers in this section have learned as the result of experience for the present summer is the fact that the trees do not need the great amount of water that they have been in the habit of giving to them. A good many of the growers only irrigated twice this season and will probably irrigate only once more. It has been found that the trees require a deal less water when the best attention is given to the question of cultivation.—Porterville Messenger.

Prune buyers have paid as high as 4¼ cents and at that price growers are not at all anxious to dispose of the small crop in hand.

Deciduous Fruit Culture

DECIDUOUS FRUIT IN THE SACRAMENTO VALLEY.

The future of deciduous fruit growing in the Sacramento Valley bears promise of a wonderful increase, especially in the line of table grapes. The area of this great valley is hard to realize. The Imperial Valley is a vast area that looks large and is a standard of greatness in the southern end of the state. Its boundaries can be seen from a central point, but not so with the Sacramento Valley. It is about one and a half times as wide and over three times as long as the Imperial Valley, and is blessed with a river water supply that is equally as abundant, more evenly distributed and capable of greater development. In addition to this, by far the greater area has an inexhaustible subterranean supply near the surface that may be pumped cheaply. All of the water in this great valley is clear except in flood time, which gives it a certain advantage for irrigation, but on the other hand, it lacks the fertilizing elements found in the Colorado River sand.

Kinds of Land.

The entire area of the Sacramento Valley, however, is not adapted to fruit growing at the present time, as it contains a large amount of overflow lands that are only available for pasture at certain periods of the year. There is an immense body of land easily outlined by the growth of oaks, that is particularly well adapted to the growth of a large variety of deciduous fruits.

The great variation in character and depth of soils, gives a wide range of possibilities in fruit growing. There are always uncongenial combinations of soil and climate for the perfect growth of certain fruits which is in a way a blessing, as it specializes certain districts. For instance, Tokay grapes can only be grown to perfection in certain districts.

As to Walnuts.

Any one questioning the adaption of the soil to the growth of walnuts need only to look at the immense native trees, some of which are over four feet in diameter and over sixty feet high. These trees, when grafted to French or Persian walnuts, make a perfect union, though of an inferior grade. While the soil is ideal for them, the still hot days of July and August give the kernels a dark color and very often ruin a large per cent of the crop by actually burning the nuts. This is, however, considerably modified by the culture given the trees. The nuts on trees which receive no cultivation or irrigation are 50 to 80 per cent burned during the hottest weather, while those on cultivated land are but slightly injured. What irrigation would do toward producing a better nut, we cannot say.

Peaches.

There is a vast improvement in the appearance of the peach orchards during the past two years. Gum disease was formerly prevalent. Spraying has solved the problem. "Spray early" is the slogan now among the growers. Late rains make late spraying uncertain.

There is an immense crop of peaches this season, many orchards being nearly ruined by the trees breaking down. It has been discovered that early irrigation renders thinning unnecessary, all of the fruit making large sizes. This is the case on the peach lands of Sutter county at least, but it has its bad feature, and that is the breaking down of the trees. Growers will learn that it will pay to prop their overloaded trees or else prune severely to produce a strong, stiff tree.

Apricots.

There is little planting of apricot trees, and many old orchards have given way to vineyards. This will have a tendency to make apricot prices stiff in the future, and the low prices offered for this fruit the past season will only aggravate these conditions.

Grapes.

Many hundreds of acres of Thompson Seedless grapes are being planted each year, and the area which is adapted to their growth seems unlimited. They are bringing only $12 to $16 a ton delivered at the dry yards this year, but their productiveness makes them profitable at that price.

The combination of Tokays on the red lands and Purple Cornishan on the darker clay lands makes the area for these two popular shipping grapes extensive.

Figs.

Fig culture is claiming much attention, and the area suitable to its culture is still unknown. The White Adriatic is the most popular variety, and is being extensively planted. The Calimyrna fig is claiming very little attention, though it will undoubtedly be planted extensively wherever it is proved that it is well adapted to the locality.

When one stops to contemplate the area that may be used in the cultivation of the various varieties of fruits in the Sacramento Valley, it can be clearly seen that the population of the valley will eventually aggregate millions of people producing fruits and farm products for all parts of the world, just as Southern California is destined to produce its citrus fruits.
—J. W. Mills, Marysville.

ADVERTISING.

The California Fruit Growers' Association, working in conjunction with the Union Pacific Railway, determined upon a publicity campaign to get people to buy oranges. The fruit growers wanted an enlarged market and the railroad wanted a long haul to the market, so together they bought newspaper space to tell Iowans of California oranges. The first shipment of oranges comprised a full train and the fruit found a ready market. A second train of twenty-five cars brought more than the market price. Iowans this year increased their consumption of oranges by 70 per cent. over any year preceding. The people were satisfied with the fruit, the Union Pacific was satisfied with its returns from the freight charges, and the growers were well pleased with the prices which the fruit brought. All three got their money's worth and the railroad and the association have their principal expended in advertising back in their pockets and along with it the reward of enterprise.

But the profit is not all accounted for yet. Interest on the original advertising outlay will be collected by the railroad and the fruit growers for years to come.

Does advertising pay? No practical man of affairs presumes any longer even to consider the question one of a debatable nature.—Racine (Wisconsin) Times.

CONSERVE THE SOIL.

MR. JAMES J. HILL, in his masterly address at the Growers' Congress, on "The Natural Wealth of the Land and its Conservation," dwelt at some length and with great emphasis on the exigencies of the increasing exhaustion of our soils under the system of agriculture thus far practiced. "There are two ways in which the productive power of the earth is lessened: first, by erosion and the sweeping away of the fertile surface into streams and thence to the sea, and second, by exhaustion through wrong methods of cultivation. The former process has gone far. . . . Millions of acres, in places to the extent of one-tenth of the entire arable area, have been so injured that no industry and no care can restore them.

"Far more ruinous, because universal and continuing in its effects, is the process of soil exhaustion. It is creeping over the land from east to west. . . . The richest region of the West is no more exempt than New England or the South. The soil of the West is being reduced in agricultural potency by exactly the same processes which have driven the farmer of the East, with all his advantage of nearness to markets, from the field.

"The average yield of corn per acre in 1906 was less than it was in 1872. We are barely keeping the acre product stationary. The average crop of the country now ranges from 12½ in ordinary years to 15 bushels per acre in the best seasons. And so it is on down the line."

He also pointed out the overshadowing importance of the conservation of the soil. "I have dwelt upon the conservation of farm resources because of the commanding importance of this industry and because of its relation to our future. Nearly 36 per cent. of our people are engaged directly in agriculture. But all the rest depend upon it. In the last analysis, commerce, manufactures, our home market, every form of activity, run back to the bounty of the earth, by which every worker, skilled and unskilled, must be fed and by which his wages are ultimately paid. The farm products of the United States in 1906 were valued at $6,794,000,000 and in 1907 at $7,412,000,000. All of our vast domestic commerce, equal in value to the foreign trade of all the nations combined, is supported and paid for by the land. Of our farm areas only one-half is improved. It does not produce one-half of what it could be made to yield; not by some complex system of intensive culture, but merely by ordinary care and industry intelligently applied. It is the capital upon which alone we can draw through all the future, but the amount of the draft that will be honored depends upon the care and intelligence given to its cultivation.

"Were any statesman to show us how to add $7,000,000,000 annually to our foreign trade, it would be the sensation of the hour. The way to do this in agriculture is open. Our share in the increase would not be the percentage of profit allowed by successful trading, but the entire capital sum. On the other side stands the fact that the unappropriated area suited to farm purposes is almost gone, and that we have been for the last century reducing the producing power of the country. Nowhere in the range of national purposes is the reward for conservation of a national resource so ample. Nowhere is the penalty of neglect so threatening."

In conclusion Mr. Hill briefly indicated the method by which reform may be brought about. "I have endeavored to outline some of the principal issues at stake in the better conservation of our national resources, and especially that one about which all the others revolve and by whose fortunes we shall eventually stand or fall—the land itself. They are for us quite literally the issues of national existence. The era of unlimited expansion on every side, of having but to reach out and seize any desired good, ready provided for us by the hand that laid the foundations of the earth, is drawing to a close. The first task, it seems to me, must be to force home the facts of the situation into the public consciousness; to make men realize their duty toward coming generations exactly as the father feels it a duty to see that his children do not suffer want. In a democracy this is a first essential. In other forms of government one or two great men may have power to correct mistakes and to put in motion wise policies that centuries do not unsettle. A part of the price of self-government is the acceptance of that high office and imperative duty as a whole by the people themselves. They must know, they must weigh, they must act. Only as they form and give effect to wise decisions can the nation go forward And we should not be here today were it not that the principle of a conservation of national resources as the foremost and controlling policy of the United States henceforth is coming to be seen by many, and must be heartily accepted by all, as the first condition not only of continued material prosperity, but also of the perpetuation of free institutions and a government by the people. The work now being done by the Department of Agriculture and the agricultural colleges of the various states furnishes a broad and intelligent foundation upon which to build a new era of national progress and prosperity. It calls for a wise, generous and continuing policy on the part of both Federal and state governments."

PROMOTION COMMITTEE MEETING.

California in her relation to the tourist is going to be fully set forth and discussed at the Tenth Semi-Annual meeting of the Counties Committee of the California Promotion Committee, which is to be held in Los Angeles, Saturday, November 14, next, according to the report just made of the Commtttee on Theme, which was appointed at the last semi-annual meeting held last June at Santa Cruz. The theme as selected for the Los Angeles meeting is "The Tourist in California," and the committee which has charge of the programme is now at work subdividing the theme into interesting topics and selecting the various speakers who will give the ideas on the subject concretely for after general discussion.

The tenth semi-annual meeting of the committee bids fair to be one of the most interesting that has been held by the committee, and already the numerous inquiries received about the meeting show that there will be a heavy attendance from all parts of the state. A special programme of entertainment will be provided by the people of Los Angeles, which will give the delegates and visitors opportunity to see all of the points of interest in and about that city.

These meetings of the Counties Committee are constantly growing in interest, and they have now become one of the great features in harmonious development work in California, through the close co-operation of all the organizations of the state, which have been brought into affiliation by the work of the California Promotion Committee.

At the meeting of the Counties Committee last June, every county in California was represented, as was the case at the previous meeting held at Fresno, and it is expected that this will not only be the case at the Los Angeles meeting, in November, but the representation so far as commercial and civic organization is concerned, will show a much greater attendance.

FRUIT BUD FORMING.

Often the question is asked, in what time of the year do such and such trees and vines form fruit buds?

Strawberries develop fruit buds in fall for the next year's crop. Raspberries, blackberries, grapes and almost all of what are called small fruit form fruit buds in spring. Apple trees and almost all other trees form fruit buds in the fall, mostly during the months of July, August and September, owing to the season. In dry weather they will form buds earlier and often, in case of wet weather change fruit buds, when not fully developed, into leaf buds.

If trees are injured by rabbits, mice, borers and by too deep plowing close to the trees, thus cutting many surface roots, their growth is checked and their vitality injured, which causes the tree to form too many fruit buds. A tree very badly injured may leaf out in the spring, bloom very full, may half mature the fruit and die; then most people are ready to say that tree bore itself to death, when the death blow that nearly killed it occurred months before.—Jacob Faith in Southwest Mail.

HORTICULTURAL ECONOMY.

"Horticulture is affected more or less by nearly every science, and by nearly every art. Every walk in life is affected by the horticulture of the country, and in turn as we are able to take the advantage of the best of everything, we will be able to prosper. During some periods, our greatest needs lie in the direction of better methods for controliing insects. At other times informaion on disease is needed most urgently. At one time we were in great need of information on fertilizers. It seems to me that what we are now needing most of all is information that will enable us to put our crops into the hands of the consumer at the least possible cost. We need a sort of horticultural political economy."

The State fair at Sacramento last week was given the most liberal attendance that any fair in California ever had. It was the last exhibit ever to be made in the old pavilion that is on the corner of the State Capitol grounds.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

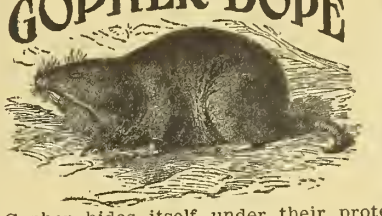
GOPHER DOPE



Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Free on board cars at Los Angeles. Live agents wanted in every county.

Yours very truly,

WEATHERING OF FARM MACHINERY.

A machine of wooden parts if exposed to the weather will warp and the parts of the machine will be thrown out of adjustment and it will do poor work. The paint will come off in a season and cracking and rotting begin. Rust will soon affect the metal parts and within a very few years the machine, which with proper housing when not in use would have lasted twice as long, is consigned to the scrap heap.

The open shed for machinery is used in many places. This is not satisfactory, though much better than leaving machinery in the field. The closed shed with a good floor made of either planks or gravel is more practicable. All machinery should be kept in the shed when not in use. Plows, cultivators, shovels and all unpainted metal parts should be oiled when put away for some time. For this purpose some heavy oil which will not run off or evaporate too quickly should be used. Fill all oil-holes at the close of the season. It will prevent rusting of the bearings. The natural life of the common farm machinery should not be three or four years but multiples of these. And if good sheds were provided and used and machinery kept well oiled and in good repair the life of farm implements would be much lengthened.

"POISONED SOILS."

Elsewhere is given a popular account of a theory of soil poisoning which has been developed and declared, so it is said, by government experts in soil investigation. We would not care to enter into any controversy on this subject. It may be, very probably is, true that some plants have the effect of producing poisonous substances in the soil, or rather the process of growth leaves a residue that is detrimental to other plant growth. When fire burns wood an ash is left which is a dead substance and which would prevent further combustion. So when the elements of the soil are combined so as to make plant growth certain changes are made which will prevent other plant growth.

But the significant thing about all this discussion of "poisoned soils" is the effort to account in some way for things which contradict old established theories as to soil fertility and plant growth. It seems that the science of agriculture, as it is in the books, has built upon a theory that the soil contains certain elements of plant food, that these are limited in quantity, that the plants use up some of this food and that when the plant or the seed is carried away the supply of plant food is decreased. The next step is to add to this plant food by supplying something from the outside fertilizers. In addition there is a way of adding to this plant food by the planting of certain crops. Yet all this fails to account for the fact which has been discovered that the usefulness of a soil may not be found out by a chemical analysis.

In short, the facts do not fit in with the old theory. Hence some new theories or additions are necessary.

Now, may it not be that the old theory about the exhaustion of the soils is a trifle off? May it not be in fact that the plant food is being manufactured from year to year in the soil rather than that there is a draft from a storehouse supply of fixed amount?

It is shown, so these experts say, that by adding a certain substance to the soil, which substance is not of itself a plant food, a sterile or dead soil may be converted into a highly fertile soil. Is it not possible that the addition has changed the physical condition of the soil so as to permit the use of the plant food already there? At any rate, why assume that there is a poison in the soil which has been removed in some mysterious way?

But, however it may be, the subject is an interesting one. It leads inevitably to a further discussion of the subject. It leads to investigations and experiments. And above all else, it leads away from the conventional theories which seem to have bound down all scholarly consideration of soil physics. If it does nothing more it will certainly lead to a consideration of the effect of cultivation upon the soil, and out of this will come a broader knowledge of the details of farm work.—Campbell's Scientific Farmer.

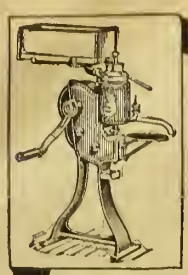
VINEGAR MAKING.

First clean the barrel in which the cider is to be placed by scalding frequently with boiling water, subject it to live steam or fumigate with sulphur to destroy mould spores. Use only mature fruit, free from decay and mould. Grind apples in a cider mill, press out the juice and place in barrel. Do not fill the barrel, but let the depth of cider correspond to the surface exposed. The greater the surface exposed to the air, the sooner (under proper conditions) will the vinegar be ready. Dissolve a yeast cake and add it to the cider. This will set up a fermentation which should not be interfered with, but allowed to go till it stops. If you have mother of vinegar in an old barrel, place a little of it in the cider to inoculate it. This contains acetic acid germs and will increase, forming a scum which should not be broken. Keep the barrel in a warm place. A good temperature is eighty degrees Fahr. Most people place a quart bottle in the bunghole of the barrel, possibly to keep out the flies. This is a mistake, as it prevents the free access of air. It also excludes one particular fly, a small yellow one, that is found about the vinegar vats and over ripe fruit. It carries acetic acid germs to the cider and hastens the manufacture.

If kept at the proper temperature, and ripe fruit has been used, the vinegar may be used in four months. It ought then to be racked off into another clean barrel.



The 1908 Improved
U. S. CREAM SEPARATOR
Meets every emergency in the Dairy

It has a solid, low frame; waist low supply can without the back breaking low crank; simple yet thoroughly efficient bowl, holding World's Record for cleanest skimming; is thoroughly lubricated, as gears run in a pool of oil, and has ball bearings at high speed points, making it the easiest running separator made.

Do not delay longer in the purchase of a separator and buy no other until you have seen our catalogue No. 20 sent to any address on receipt of a postal.

SORGHUM FEEDING.

IT IS too bad there is prejudice in the minds of dairymen against sorghum. This valuable and easily grown food for dairy cows is neglected from want of a little knowledge in feeding it. Perhaps the prejudice has arisen from cases where a little previous thought would have prevented the injury to the animals. The thought most needed in this world is forethought for hind thought comes a long way behind the disaster. The dairyman watches with apprehension the grasses growing shorter and shorter in the fields, and, each milking, less and less milk in the cans. Waiting and waiting for the sorghum to grow tall enough to cut for fodder is seemingly an endless weariness. Sorghum grows very slowly when first planted, then it rushes away into maturity with greatest rapidity.

Time to Cut.

The sorghum is ready to cut for soiling when it reaches the third joint in growth. The plant must not be cut below the first joint, or it will not sprout again. If cut only to the first joint and watered, it will start to grow at once and make several cuttings before it is necessary to let it go to seed. In many of the warmer parts of the state the frosts are not severe enough to kill it down completely and it comes again in the spring from the same root. In California it is almost impossible to secure sorghum seed that has not a mixture of broom corn in it. The seed has to be gathered from time to time, as it ripens rather irregularly in the field. When it is left to mature all at one time the birds take the first ripened seeds and leave the farmer short. The linnet is the sinner. I never see any other birds harvesting the seeds. Linnets are not a protected bird at any season of the year. I think it is reasonable they should not be, for they multiply very fast and are destruetive to the fruit tree buds.

Feeding.

When the sorghum is ready at last, now comes the glad time. The dairyman and his men rush out with the teams, cut a quantity, and gloating, feed it to the waiting cows. The dairyman's heart is full of kindness and he thinks as he looks at the eager herd: "You hungry beasts, fall to and eat your fill, at last, for there is plenty more coming now." The cows gorge themselves on the lusciousness; for the sin of gluttony quickly comes the punishment of pain. In many cases, the cows have been more starved than the dairyman thought. The dairy cow is deceptive in that she stores up her fat internally and not until this inner fat is used up does she begin to lose condition otuwardly. Now the cows stuff themselves on sorghum, bolting down great mouthfuls. Some bloat, but recover; the worst bloated ones die, while others merely have bad cases of indigestion. There is a racket for awhile around that barn, with men running in every direction to relieve the poor suffering things, everybody excited and worried. After the flurry is over, the victims buried, the dairyman cogitates for awhile, then resolves never, never to grow any more sorghum! Foolish resolution! Better resolve that he will find out why sorghum, loved by the cows, cannot be fed to them with safety. That is the proper way for a man to talk; the other way of deliberately sacrificing the valuable sorghum crop is too unreasoning for even the cows!

Personal Experience.

I have fed sorghum to horses, cows and pigs; sheep I have not owned and therefore leave them out of the count. I have fed more or less sorghum for twenty years and do not remember losing a single head of stock from it I have fed alfalfa the same number of years and believe that a hundred head of calves and cows would not cover the number that have died directly from alfalfa bloating. I still feed and pasture alfalfa and always hope to have it for feed. I know it is the best of feeds but must be handled with care. Sorghum is good feed. If used one season I doubt if the dairyman will ever again be without at least a small patch of it. The feeding at the first of the season must be carefully watched. Here is where the eye of the master saveth his kine. If the cows are being fed cut or soiling crops in the yards the change is readily made. Mix in a quarter of sorghum with the other feed, cutting the sorghum into foot lengths to prevent one cow getting too much After a few days leave it full length, then gradually increase the amount until at the end of ten days the racks may be filled up completely and the cows allowed to eat all they desire.

Pasture.

When cattle are at pasture the sorghum is fed on the ground, widely scattered. Five stalks to a cow is enough until they grow accustomed to it. The practice of turning cows into the corn or sorgnum fields after the rains have started mildews and rotting I do not believe is safe. Decaying vegetation is not wholesome for either man or beast. The regular corn stalk disease, whatever may be the cause of it, has never been known in California. It is recognized as something obscure in the Middle West. The few cases where sorghum has been found to secrete prussic acid, eight in number, are too few for us to consider the matter as threatening to the herd.

Whenever there is more sorghum than is needed for soiling the cows, it can be cured into palatable hay. The horses are very fond of it and grow sleek and fat. The sorghum on the ranch is being cut for the silo after a small portion of the seed is removed. The seed will be used for next season's planting and save buying, for at six cents a pound it is not very cheap seeding. I note with pleasure Mr. Woodward's kind note on home made cutter for corn. I have one on somewhat the same pattern. The men find it too slow and prefer the hand knives. They really do a quarter more in a day with the corn knives. I think this comes from the fact that in California we hire only able bodied men to do field work, while back East the farmer works with his men and is not always able-bodied.

He must consider his own strength and take an easier if somewhat slower way of doing things. Next year I mean to have a regular corn harvester to cut the corn in good style. This year is a makeshift year, anyway. I took hold in the middle of things to again manage the ranch, while the wise man has been enduring the weariness of life in a sanitarium.—M. E. Sherman.

THE GOAT SITUATION.

A Texas writer states the present situation on mohair prices and problems confronting the goat men, as follows in American Sheep Breeder:

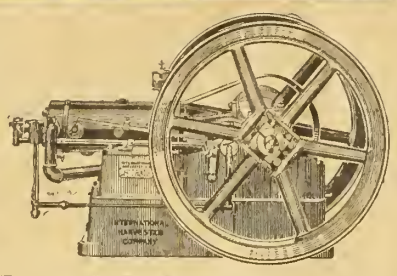
I regret exceedingly the very low price paid for mohair in the past several months, in fact, there has hardly been any market at all for mohair for something like about four months. If it were not that wool has also suffered quite as bad we goatmen would be feeling blue over the situation. Last year mohair brought from 36 to 42 cents per pound for the twelve months' clip, this year about 20 cents. Last year wool brought from 22 to 32 cents, this year from 9 to 18 cents. Of course the panic was mostly responsible for this condition, but I hardly think it entirely responsible for it, as I fear it is due more to unlawful combinations. I urged upon the goat owners in 1905 to organize with a view to controlling the market, but I met with no encouragement.

I again urged the same thing in 1906, and by considerable effort and going to considerable sacrifice of time, labor and stamps, I succeeded in getting a meeting of the most of our prominent goat breeders in San Antonio during the international fair in November of 1906; but notwithstanding we started in with a very respectable organization and with fair prospects to accomplish something and possibly did help the market for the clip following which was better than common, somehow unexplained to me, we allowed our organization to die a natural death and if we accomplished anything we soon lost all the advantages gained. There should not be an easier job than to combine the goat raisers and effectually control the mohair market in the United States. There are only three States in the Union that produce mohair to any considerable extent, Texas, California and Oregon. Texas and Oregon produce, I suppose, more than one-half of all the mohair produced.

Imported Brings More Money.

I believe I would be safe in saying that I can create a mohair famine in the United States by combining one hundred of the greatest mohair producers. We produce in the United States about 3,500,000 pounds of mohair annually, and there is consumed a considerable quantity in excess of this. There is imported, approximately, 3,000,000 pounds, but Mr. Hoerle, of New York, says a considerable quantity of this 3,000,000 pounds is short hair and should not properly be classed as mohair, hence we have no way of knowing just what quantity of this is really mohair, yet we do know that the quantity of mohair imported is considerable. The duty on mohair is 12 cents per pound and the freight and duty with original costs makes the imported product cost about 55 cents. I believe the mohair as produced in the United States, or at least one-half of our clip, to be equal to the imported mohair, the other being from grade goats, and having been clipped at six months, is too short and has too much kemp to grade with the imported. Yet it costs 55 cents to import this mohair. Those of us who produce a grade equal to that get about 36 to 38 cents for the same grade of hair in the United States. I contend if the imported article is worth 53 to 55 cents, then why should we take 38 cents for mohair just as good? Mr. Hoerle, who resides in New York city, and is in a position to know better than any of us, in speak-

The GREAT AMERICAN DESERT is DISAPPEARING



THE great ranges are fast being taken up by individual settlers, and thousands of prosperous farmers are taking the place of the few cattle kings that were monarchs of the ranges a score of years ago.

It is the story of the magic touch of water upon the dry land.

I. H. C. Gasoline Engines in Irrigation Enterprises.

If you have not kept yourself posted on irrigating matters, you will be surprised at the important part I. H. C. gasoline engines are taking in the reclamation of these waste lands.

Hundreds of settlers and farmers have no other means of getting water upon their lands than these engines.

These settlers and farmers are cultivating all sizes of farms, from garden spots to "forties" and "eighties" and quarter sections and even larger tracts. They are among the most prosperous farmers in the irrigated sections. They are raising grains, alfalfa and other grasses—vegetables, fruits, etc.

They find that with an I. H. C. engine they can get water in large quantities upon their land, and that they can get it dependably and economically. They find the I. H. C. engine method of pumping more direct, more profitable and more satisfactory than any other means heretofore employed.

I. H. C. gasoline engines are simple, dependable and powerful. They pump water economically, and you will find that they run with very little attention.

If you have an irrigation problem it will pay you to investigate and see what an I. H. C. gasoline engine will do for you.

Vertical engines in 2 and 3-Horse Power.

Horizontal engines (Portable and Stationary) in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Also, gasoline traction engines, pumping, sawing and spraying outfits.

Call on the International local agent, or write the nearest branch house for catalog and colored hanger.

INTERNATIONAL HARVESTER COMPANY OF AMERICA, CHICAGO, U. S. A.

(Incorporated)

ing of the recent great drop in the mohair market says: "Some of the early clips brought as much as 36 to 38 cents, then some mills and some speculators combined.

Worked the Game.

One mill closed up entirely, for a short time, probably for repairs, and others partly; and then a general calamity howling began, which was heard with terror by every breeder in the United States." We mohair producers became panic stricken and rushed our hair upon the market at any old price and, of course, the speculators and the mills reaped a rich harvest. They are now educated to a low price and it will be difficult to get the price to what it should be. An article is not sold at what it is worth so often as what the same article can be bought at in the market. It does not imply because mohair is sold for 20 cents that it can be produced profitably at this price. No man posted would contend that you could produce mohair in the United States and make money at these figures. There is no money to be made at less than 25 cents for the six months' clip. Mohair should bring from 25 to 35 cents for the short clip and from 45 to 60 cents for the long. By properly organizing and controlling these things we would have no difficulty in getting approximately these prices.

Mr. Hoerle says in speaking of wool: "During the March sales in London, the best Australian Delaines brought from 90 to 92 cents on a scouring basis, which is equal to $1.25 laid down in New York, duty paid. Our own best Ohio Delaines brought then only 75 cents and the mills themselves admit that the latter is fully equivalent to the former." He winds up by saying that mohair is in the same boat, which every well posted man knows to be true. If wool, when scoured is worth $1.25 per pound or even 75 cents per pound, why is it that mohair which is free from loss by reason of grease and dirt, wool losing as much as three-fourths of its weight when scoured brings less than one-half of this? In other words wool that sells at 25 cents, when freed from its grease and dirt costs the purchaser for the scoured product 75 cents per pound and how is it that mohair which is free of dirt and grease will not also bring 75 cents per pound when the manufactured article made out of mohair brings more upon the market than the manufactured article made out of wool? These are things that we mohair producers should think over and we should organize and get our rights.

Cotton Growers Succeeded.

Look at the cotton farmer. Why I remember of seeing cotton sell on the streets of Dublin at from 4 to 6 cents per pound and I have heard farmers say repeatedly that if they could only get 8 cents they would be satisfied, but when their organization was first formed they clamored for 10 cents and they got it and then they clamored for 12 cents and they got it, and last year they asked 15 cents and had not the panic come, they would have succeeded in getting that and notwithstanding the panic most cotton was sold at from 11 to 14 cents. Think of it, cotton from 11 to 14 cents, mohair 18 to 20 cents. Cotton fabrics 15 cents per yard, mohair fabrics 75 cents to $2.50 per yard. The prices on cotton did not go to pieces like wool or mohair and why, because the farmer was organized and would not stand for it. I have heard the cotton buyers and the speculators and the merchants and the well read and posted man argue that cotton could not go over 8 cents, because the Chinaman and the Filipino and the African and peons of South America and of Old Mexico and the citizens of India were our largest consumers, these being very hot countries and on account of cotton fabrics being both cheap and cool the trade with these people was where we disposed of our great surplus in cottons and then the wise ones said these people were so poor they could not buy if the price was greater than 8 cents, and they also predicted that in a few years the German and the French and the English and the Belgium colonies in Africa and India and Mexico and Argentine republic of South America would produce cotton in great quantities with pauper labor and would sell it at 3 cents per pound, but I notice that cotton has steadily climbed in price and all the wise ones have proved false prophets.

Three Million Organize.

If the cotton producers, about 3,000,000 or more of them, can organize and accomplish such results why is it that a handful of a few hundred goat raisers can not gather in an organization and get their rights? The United States produces about 12,000,000 bales of cotton or about 600,000,000 pounds. We goat men produce about 3,500,000 pounds of mohair. Erath Co. Texas, raises in value in cotton more than all the mohair producers in the United States. One hundred of the greatest mohair producers could accomplish wonders and 500 would control absolutely the entire or almost the entire output of the United States.

Can't we get a few hundred together when the cotton people have several millions banded together? I shall not apologize for taking up the greater part of this article in discussing the want of an organization, because if there is any one thing that is needed just now it is just such action and the exigencies of the case require just such a lecture as this.

A few years of just such prices for mohair would hit the industry in the United States such a staggering blow as it would be years and years recovering from. Suppose all those who have been select breeders and built up the very best flocks in the United States and their fathers before them, and their predecessors by years and years of intelligent and select breeding should become disgusted and sell out to Tom, Dick and Harry, who would breed down instead of up, as the most of our goat men are doing, and in a few years we should destroy in this way all the fine goats in the country, where would we go to get seed to start the industry new again? Have you thought of that? Only two places on the civilized globe that they can be had, that is worth having outside of what is in the United States, and that is Turkey and South Africa, and the government of Turkey absolutely prohibiting the exportation of a single head from that country, and there being $500 export duty on every head taken from South Africa. To destroy the industry in the United States would be the short-sighted policy of killing the hen that laid the golden eggs. There are millions of acres of land in the United States that are practically worthless except to produce goats and mohair. We should be exporting mohair instead of importing it and having it bring millions to this country instead of sending millions away for it.

Organize.

Now I have in the past given good advice to the goat men and I will give you some more that will be worth more to you and to the country and to the mohair and goat interests than any heretofore given by me and that is this: "Join a compact organization that has for its object to better prices for mohair and goats; or sell out at once to some man who will." I am not suggesting what organization but if there is none in existence induce some leader to start one and not only join, but have all your neighbors do so, and don't expect to have the invitation fee 10 cents or 25 cents, as it will take money to accomplish this, and we should be willing to pay it as the results will be many times our money back to those of us who remain in the business.

Those of us who have money that we could spare should make loans upon the mohair of those who can not hold and in this way aid each other to hold until a living and a decent price can be obtained. Did you ever stop to think that the last spring's mohair clip came only to about $600,000 in the entire United States? I can find enough enterprising men in Dublin as small and as insignificant as the town is to corner the mohair market at these prices. If it were not a violation of the law to form such combination, I would attempt the forming of such combination by capitalists with a view of cornering this product. It is time that the goat men were waking up or selling out to some man who is capable of waking up, or soon all those who are thoroughly awake will get out of the business. What we need is an old time revival. Mr. Hoerle says, "our system of marketing bears the blame." To this I agree.

HOG CHOLERA CURE.

The Cultivator is asked regarding the recent discovery of the prevention of hog cholera. This cure was announced at the convention held at Ames, Iowa, in May, and regarding it we note in an Eastern Exchange:

The great news of the convention was the discovery of a cure for hog cholera, and the exact nature of the disease and the successful methods of combating it were fully and practically demonstrated, so that each official present obtains such a mastery of it that he may return to his own state fully armed to cope with the disease.

For over thirty years the United States experts have labored continuously on the problem. Doctor De-Schweinitz began the work, which at his death has been taken up and carried to a successful culmination by Doctor Dorset and his assistants.

At first attempts were made to develop antitoxins by the use of artificial cultures, but the ultramicroscopic nature of the germs made this impracticable.

Later, knowing that animals which had recovered from this disease were immune, these men concluded that immune bodies must exist in the blood of such hogs. But it was soon found that these immunizing bodies were not sufficiently numerous in the blood of the recovered hogs to render exposed animals immune when injected into their blood.

Consequently these animals were hyperimmunized by injecting them with infected blood and by feeding them

EVERYBODY
BUYING
DE LAVAL
CREAM
SEPARATORS

The wonderful improvements made in the 1908 DE LAVEL CREAM SEPARATORS—added to their 30 YEARS record of ONE MILLION prosperous users throughout the world—have convinced practically all WELL-INFORMED buyers of their overwhelming superiority, as well as actual cheapness, and they are being bought in even greater proportion this fall than in the spring or ever before.

A catalogue to be had for the asking shows the reasons WHY.

DE LAVAL DAIRY SUPPLY CO.

108 So. Los Angeles St. LOS ANGELES

the viscera of animals that had died of the disease.

By this method of treatment the serum of these hyperimmunized hogs became sufficiently impregnated with antitoxin body to render hogs immune when they are injected with it.

A number of experiments performed by Doctors J. H. McNeil and Stange amply prove the success of the method.

Experiment No. 1 included 16 hogs, consisting of Poland Chinas, Duroc Jerseys, Chester Whites and some crosses.

Six of the animals were treated by injecting 20 cubic centimetres of mixed serum taken from several hyperimmunized hogs into the inner muscles of the thigh; six more were treated with 20 cubic centimetres of the same serum and in the same manner, but in addition two cubic centimetres of blood taken from a sick animal was injected into the opposite thigh.

These 12 hogs with four untreated hogs (checks) were exposed to a natural outbreak on the farm six days after inoculations were made. A number of animals on the farm had died and several were sick at the time the exposure was made.

As a result of the exposure two of the animals treated with serum alone died. Another was sick for several days.

Of those that received serum and blood, two died. Three of the four checks died. None of the animals became sick as a result of inoculation.

Experiment No. 2 included eight hogs. These eight were injected as lot No. 1, with 20 cubic centimetres of the same serum and two cubic centimeters of the same blood.

Forty-eight days later they received a similar treatment with a different serum and blood which had been found virulent.

The animals were exposed to a natural outbreak on a farm twenty-four days after the last treatment.

None of the animals became sick as a result of the exposure, while 75 per cent of the untreated animals exposed at the same time died of hog cholera.

Experiment No. 3 included eight hogs. This lot were treated with 20 cubic centimetres of the same serum used in experiment No. 1 and first injected in No. 2.

Forty-eight days later they each received 20 cubic centimetres of another serum in the same manner, and twenty-four days after this tretament they received from 25 to 30 cubic centimetres of serum (depending upon the size,) and were exposed immediately under the same conditions as lot No. 2.

Of these one died, while three of four untreated animals exposed at the same time died of hog cholera.

Experiment No. 4 included six hogs. Four were treated with 30 cubic centimetres of serum and two with 30 cubic centimetres of the same serum and two cubic centimetres of virulent blood (tested.) The amount of serum used was increased on account of larger animals.

All were exposed in closed pen containing three sick animals. The pen was one of the Bureau of Animal Industry exposure pens. The sick animals originally in the exposure pen died in four or five days and post-mortem examinations showed lesions of hog cholera.

None of the treated animals became sick, but three of four untreated hogs exposed in the same pen died, and the fourth was sick several days.

Experiment No. 5 included six hogs. Of these four were treated with 30 cubic centimetres of serum as used in experiment No. 4. Two were treated with 30 cubic centimetres of serum and two cubic centimetres of disease-producing blood.

All animals were kept from all sources of infection for two days and were then exposed to the disease under the same conditions as those in experiment No. 4.

None became sick, while 75 per cent of the untreated animals died and the remainder became sick.

Not a single animal became sick as a result of the treatment.

On the evening of May 30th a public meeting was held at the college. Secretary Wilson on account of a hurried call from town was unable to be present. Doctor Melvin, Chief of the Bureau, said, in part:

"There are about 9,000,000 hogs in this state. When one considers the deaths that occur in some seasons from hog cholera the loss is tremendous. If this remedy is successfully placed before the farmers it will doubtless mean the saving of millions.

"If thoroughly systematized, it is expected that the herds where the disease exists can be treated, and those surrounding the outbreak, and thus reduce it to a minimum. This should eventually result in the total eradication of the disease."

THE STUDENTS' JUDGING CONTEST.

At third annual National Dairy Show, which is held in Chicago December 2 to 10 inclusive, will be held a students' judging contest. Any student of an agricultural college or of a secondary school which is under the direct supervision of a state agricultural college, who is regularly matriculated in at least a two-years' course in agriculture or dairying and who has taken not less than twelve weeks work during the calendar year in which the show is held, may enter.

There are six teams who have already expressed a desire to enter this dairy judging contest. Any institution interested in this contest may obtain a copy of the rules and regulations governing it by writing directly to B. H. Rawl, Dairy Division, Washington, D. C.

The dust from clay soil is especially absorbent and without any admixture whatever will almost instantly neutralize offensive odors and render innoccuous miasma-breeding pools and slimy open drains. Where the latter are necessary it is well to fill them in frequently and replace them by fresh ones, unless they can be flushed out or treated with disinfecting fluids as often as they become offensive to sight or smell. A few cart loads of dry earth can easily be put under shelter in stable or out buildings. It proves an inestimable convenience in the poultry houses and stables, when cleaning is difficult and when some rapid absorbent is necessary in the case of sickness among the larger animals or fowls. Temporarily, too, any of these that may die and cannot be interred, may be covered with a dust blanket until they can be more deeply hidden from sight.

Don't Wait 'till They Sing

You make yourself unneccessary expense for repairs every time you use a poor wagon grease or allow an axle to go dry.

An occasional application of

MICA
Axle Grease

removes two thirds of the trouble and cost of keeping a wagon. Try "Mica" next time you go for a load—you'll *see* the difference and the horse will *feel* it.

Mica Axle Grease is almost as good as roller bearings. Ask the dealer for it.

Contents

FIFTY-FIFTH AGRICULTURAL FAIR, Cover.

CALIFORNIA STATE FAIR, 243.

CITRUS.—Poultry Manure; Fertilizer Suggestions; Sapota; Suit Over Orange Boxes; Orange Crop Will Be Good, 244, 245.

DECIDUOUS.—Deciduous Fruit in Sacramento Valley; Advertising; Conserve the Soil; Promotion Committee Meeting; Fruit Bud Forming; Horticultural Economy, 246, 247.

GENERAL AGRICULTURE.—Weathering of Farm Machinery; Poisoned Soils; Vinegar Making 248.

LIVE STOCK AND DAIRY.—Sorghum Feeding; The Goat Situation; Hog Cholera Cure; Students' Judging Contest, 249, 250, 251.

EDITORIAL.—Not So Original; Education for the Farmers; Farmers' Institutes; Farm Names; Small Hop Crop, 252.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 253.

POULTRY.—Prevention of Roup; Poultry Brevities; Teaching Chicks to Roost; Molting Period; Raising Guinea Fowl; Turkeys on the Farm; Vegetable Stimulants, 254, 255, 256.

ORNAMENTAL GARDEN.—Back Yard Gardens, 257.

QUERRIES AND REPLIES.—Butter Won't Separate; Peaches Not Coloring; Ropiness in Milk; Poultry Manure; Mites, 258.

VETERINARY.—Sunstroke; Glanders; Undeveloped Teat; Paralyzed; Dilator, Fistula; Spavin, 258.

HOUSEHOLD.—Outclassed; Chrysanthemums; How to Restore Leather; Raspberries and Blackberries; To Exterminate Ants; Recipes; Homely Hints, 260, 261.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market. Citrus Markets, 262, 263.

NOT SO ORIGINAL.

We sometimes feel our own importance and believe many of our own ideas are quite original, whereas we may be but repeating what others have worked out years ago. For instance, in our warfare against scale and other pests of growing plants, California has made a strong fight to introduce the "bug which eats the bug." In this field we have felt we were on original ground, and perhaps in a sense we have been; at least pronounced success in one or two cases has attracted attention to that feature of economic entomology in a way which has done good the world over. But we now note a page of an old Moore's Rural New Yorker, bearing date of August 11, 1860, which was kindly sent to this office a short time ago by a subscriber, containing reference to the Ichneumon fly, destroying the wheat midge. A shrewd old farmer of York State had kept his eyes open and wrote in to the paper as follows:

"They were very numerous on the heads. A few evenings before I saw the midge fly quite plenty in heads of wheat, but since this insect appeared I have not seen any. The Ichneumon (if this is it,) appears on the heads of wheat at the same time of day the midge formerly did: that is, near sundown, when it is still. Those I saw were very busy reaching their noses into the crevices of the heads of wheat. They resemble the pea bug somewhat; forward they resemble the ant, their nippers being the same fashion. On the 18th and 19th I saw them in fair daylight, and found they had a little tinge of yellow each side of the back; under the nippers they have a feeler, which is used very dexterously. Whatever name they go by, I am sure of what they are about. I have just seen them in a later sown piece of wheat, kernel half grown, and not the least indication of midge. I wish those who have late sown wheat would see if they can discover anything of the kind. I look upon it as the harbinger of better days for the farmer."

FARMERS' INSTITUTES.

The season is now approaching when institutes will be held with more regularity, and it is in order for the farmer to so shape his work that whenever an institute is held within reasonable distance that he may attend and also take along the entire family. We believe that one reason why the farmers' club has become so popular in Southern California and the Grange in Northern California is because the social feature in which the whole family could engage has been made a strong factor. It is advisable because of the added interest which it gives to the institute and, besides, educates the children that they will always be ready to seek such opportunities to get the best and latest information regarding soil culture and the disposition of its products.

ALASKA-YUKON.

The Live Stock Department of the Alaska-Yukon-Pacific Exposition has completed the "Preliminary Prize List" for the exhibition of the various breeds of live stock at the Exposition during Sept. of 1909, An expenditure of $100,000 will be distributed among the successful exhibitors and for the promotion of live stock interests in connection with the exposition. F. A. Welch, Salem, Oregon, is the secretary.

FARM NAMES.

The names for farm homes continue to come to the Cultivator, and a nice bunch of attractive names is already in hand. But owing to articles regarding the State Fair and other features this week they are unavoidably laid over. We hope these names will continue to come, that we may get a list of several hundred of those who care enough for their home place to dignify it with a name.

The farmers hitherto have had less than their full share of public attention along the lines of business and social life. There is too much belief among all our people that the prizes of life lie away from the farm. I am, therefore, anxious to bring before the people of the United States the question of securing better business and better living on the farm, whether by co-operation between farmers for buying, selling and borrowing; by promoting social advantages and opportunities in the country, or by any other legitimate means that will help to make country life more gainful, more attractive, and fuller of opportunities, pleasures and rewards for the men, women and children of the farms.—President Roosevelt.

The 100-bushel wheat seems to be turning out about like the seedless apple—it is a reality but not worth having. The 100-bushel wheat lacks the good qualities of the kind that produces 25 to 50 bushels to the acre. The seedless apple looks good, but no one who ever ate one wanted another. There is a limit to the bounties nature will bestow and it is pretty safe, as a rule, to discount stories of enormous productiveness or of fruits and vegetables that possess all the good qualities with none of the bad. Every rose has its thorn.—Portland Oregonian.

We hope ultimately to double the average yield of wheat and corn per acre; it will be a great achievement, but it is even more important to double the desirability, comfort and standing of the farmer's life.—President Roosevelt.

SMALL HOP CROP.

It is estimated that the production of hops in the United States this year will fall materially below that of last. This decrease will amount to at least 40,000 bales. Last year's production amounted to about 300,000 bales.

This year's production by states is approximately as follows: Oregon, 110,000 bales; California, 75,000 bales; Washington, 20,000 bales; New York, 55,000 bales—which makes a total of about 260,000 bales. The reduction is owing entirely to reduced acreage caused by the low prices of the past two years. It is estimated that in California at least 10 per cent. of the acreage has been plowed up and another 10 per cent. has not been worked at all. Oregon shows also about the same percentage of reduction, while Washington claims that over 50 per cent. of its acreage has been plowed out.

A look at the leader on the first page this week may remind some of our readers who have been subscribers for several years that the Cultivator always comes in with a good report and fresh illustrations from our State Fair. This year there were two representatives at the Fair, last year three, the year before two, and each time there have been good illustrations of exhibits. While this year there have been some sensational and other features that were worthy of criticism, on the whole the State Fair has broken away from much that is objectionable and the Board of Agriculture is now honestly endeavoring to make it an agricultural fair. May they be supported in the effort, and may they continue to eradicate these objectionable features.

To encourage a more general use of California products throughout the world, and as a part of the broad campaign which the California Promotion Committee has instituted along these lines, the Committee will address a letter to the handlers of California fruit, the packers, driers, canners, exchanges, etc., suggesting that there be included in every package that is shipped to market an attractive lithographed display card to be placed in the show windows of the dealers. The suggestion is that the lithographs be unique and catchy and say something not only about the fruit itself but about the places where the fruit is grown. In this way not only the product but the entire State will be advertised.

It is especially important that whatever will serve to prepare country children for life on the farm, and whatever will brighten home life in the country and make it richer and more attractive for the mothers, wives and daughters of farmers should be done promptly, thoroughly and gladly. There is no more important person, measured in influence upon the life of the nation, than the farmer's wife, no more important home than the country home, and it is of national importance to do the best we can for both.—President Roosevelt.

Preliminary returns indicate a yield of winter wheat of about 14.3 bushels per acre, or a total of 425,940,000 bushels, which compares with 14.6 bushels and 409,442,000 bushels, respectively, the final estimates of last year's crop. The average quality of the crop is 90.1 against 90.5 last year.

Shop Talk

DRY FARMING BOOK.—As was suggested last week, editorially, now is the time to think of next year's crop and how it is to be handled. There is much more dependent upon the preparation of the soil for seed than many farmers know about. Especially in the West where the rainy season is a little uncertain, knowledge along this line is of great value.

As has been suggested before H. W. Campbell's "Dry Farming Manual" seems to fill this need and the Cultivator is receiving orders for it. For a short time we are going to make the Special offer of a years subscription with the book at the regular price of $2.50. The manual is the 1907 issue and is the latest out. There will never be opportunity to get it at a better figure than this and we suggest that all interested take advantage by remitting and renewing at once.

Agricultural Notes of the Pacific Coast

Northern California

Construction work is in progress on the new Feather River canal.

Canneries at Newcastle are paying $17 per ton for cling peaches.

Newcastle will produce about 2000 tons of cling peaches this season.

The bean crop of the Gridley district was materlally injured by the hot weather.

The late bean crop of Sutter county has been somewhat damaged by warm weather.

Extensive forest fires have been raging in the vicinity of Blue Tent, Nevada county.

There has been considerable trouble in the hop fields owing to unruly and ugly pickers.

One pear shipper near Marysville has shipped 50 carloads from his ranch this season.

Marysville is having a visitation of mealy bugs which are very perplexing and hard to control.

Southern Butte county has about finished its grain harvest which has been of excellent quality.

Trinity Land and Cattle Company anticipates starting a creamery at Trinity Center, Shasta county.

Lodi grape growers are organizing in order to secure fair treatment from the California Wine Association.

Oroville is forming an improvement Club for the purpose of inducing cleaner streets and a better appearing community.

Yuba county claims she is producing some of the finest Bartlett pears that can be found in any section of the United States.

Hop men of Sonoma county have decided to pay 80 cents a hundred for picking hops while those near Sacramento will pay 70 cents.

Water users at North San Juan, Nevada county, are arranging to have a more regular and more permanent supply of irrigating water.

Northern California fruit growers are making a sensible effort to secure the use of better fruits on the table of California hotels and restaurants.

The fruit district about Newcastle has shipped sufficient green deciduous fruit this season, that if made into one train, it would be over two miles long.

The creamery at the University farm at Davis opened on September 1st. The management will pay regular market price for milk or cream on butter fat basis.

Experimental work carried on by the Soil Survey branch of the Department of Agriculture at Oroville has shown that heavy adobe soil will grow alfalfa satisfactorily

An immense Tokay vineyard will be planted at Cicero, east of Galt and in Sacramento county, and the same company will also plant a large acreage to eucalyptus trees.

The California Wool Growers' Association holds a meeting this week to discuss matters regarding the tariff and the trouble with the United States Forest Reserve.

Placerville, one of the oldest mining sections of California, is now developing into a fruit section, and it is estimated that over $150,000 worth of fruit will be produced by that section this season.

Central California

Red spider is doing much damage in San Juan valley.

Gathering of beets for the Salinas sugar factory began on September 1.

Pajaro valley will market something over 2000 carloads of apples this year.

Stanislaus county claims to have the only herd of Dutch Belted cattle in the State.

Pajaro valley claims to produce more than twice as many apples as the entire state of Oregon.

Monterey county sugar beets are in excellent condition and show an exceptionally high content of sugar.

Santa Clara county schools are considering the installation of a more thorough course in elementary agriculture.

One firm of buyers at Merced have agreed to pay one cent per pound for all sweet potatoes delivered for the remainder of this season.

An Exeter, Tulare county, tobacco grower is now harvesting one of his first crops in this State. It is thought it will prove a very profitable crop.

Prof. Twight, formerly of the U. S. Department of Agriculture, has invented an arrangement for the control of thrips which he thinks will be a success.

Farms about Watsonville will produce large quantities of black oats this year. It is estimated that the section will produce 30 train loads of 30 cars each.

Tulare county orange crop is reported to be in exceptionally fine condition, and all the packing houses of that section are being refitted with new machinery.

A strike promoted among the workmen of the sugar factory of the Pacific Sugar Factory at Visalia failed to materialize and the workmen all returned to their places after one day.

The apple picking season at Watsonville is now in full swing, but many of the shipments up to the present have been to San Francisco, Los Angeles or other local points.

Some of the leading apple growers of Pajaro Valley are up in arms over the shipping of green apples of low grade, and insist there shall be more attention paid to careful grading.

The State Veterinarian has issued a proclamation to sheep men supplanting that of last year, which called for the dipping of all sheep, and now permits the dipping only of those which are actually diseased.

Careful estimates made in the Pajaro Valley place the following estimates for its output of apples this season: Bellfleurs, 1600 cars; Newton Pippins, 800 cars; mixed varieties, 600 cars; canners and driers, 500 cars.

Prof. W. T. Clarke, of the State University, recently addressed the apple growers of Watsonville, reviewing much of the history of the fight against the codling moth there and urging continuance of the campaign along more careful lines.

"Kings county sends greeting to the butter eaters of the south," is the statement of the Hanford Sentinel in an item noting the shipment of 19,040 pounds of butter, and further adds that a carload similar to that leaves for the south three times a week, or nearly $60,000 a month for butter.

Southern California

Riverside is ripening peaches and has peach blossoms on the same tree.

Santa Ana is to have a Carnival of Products, devoted to things produced in Orange county.

An El Molino, Orange county, rancher was recently fined $25 for catching quail in a trap.

It is now expected that over 1000 acres of cotton will be planted in Imperial Valley next spring.

Imperial farmers have been distressed more or less by wild ducks destroying recently planted corn.

Covina is making a thorough job of fumigation in her citrus orchards, for both purple, red and black scale.

Carnation growing is the latest effort in Imperial Valley, one grower near El Centro having started in the business.

The apple orchards of Yucaipe and Oak Glen districts, San Bernardino county, will yield much larger crops than anticipated.

The chief of the government nursery at Lytle Creek Canyon will make large plantings at Mill Creek Canyon this coming season.

A start toward an agricultural fair is to be made by a rancher near Escondido, calling for a fair on or near his place on the 15-17 of October.

J. B. Neff announces institutes for the end of this month in Orange county as follows: September 21-2, Smeltzer; September 23-4, Tustin; September 25-6, La Habra.

Prof. Smith of the Pathological Institute is urging the greatest of care in spraying tomatoes or at least being ready to spray them as soon as the wet season comes.

After some years of inactivity owing to failure to obtain necessary rights of way, the Victorville Dam Site and Water Company, San Bernardino county, will resume work.

The Southern California Sugar Company, which is building a factory at Santa Ana, has secured storage for its seed and is planning for handling a large quantity of beets for next season.

Walter Hill of Hemet has taken thirteen tons of peaches, Elbertas, from one acre. They measured two and a half inches across, and nearly all of them were No. 1s. He sold the entire crop for table use in the city.

Cantaloupe growers of Imperial Valley recently held a meeting at Brawley in the effort to bring the growers together to protect mutual interests and to secure more perfect organization than was had during the past season.

The orange growers of Hemet and Valle Vista held a meeting recently and organized the Hemet Orange Growers' Association. It will have its own packing-house and warehouse by the opening of the coming season, and will be a member of the Highgrove and Moreno division of the California Fruit Growers' Association. Two hundred and fifteen acres of oranges were represented at the meeting. A board of directors was elected, namely, D. A. Kingsbury, Mrs. Clara Graham, T. W. Hill, G. H. Johnson, W. G. Phillips, F. W. Stetson and G. C. Nevins. The officers will be elected this week.

The Coast

North Yakima fruit shipments this year were double those of last.

Orange growers at Tucson, Ariz., have formed a co-operative marketing association.

North Yakima, Washington, is making shipments of Herefords to the Hawaiian Islands.

The fairs of Oregon will all give more attention to the poultry department than heretofore.

One conserving company at Sunnyside, Washington, will make 500 tons of tomatoes into catsup.

State Fair of Oregon will open at Salem on September 14th and will continue until the 19th.

Seventy-five carloads of fresh fruits were shipped out of Weiser, Idaho. This is its heaviest fruit shipment to date.

Oregon has passed a law with extensive provisions against objectionable weeds along roadsides and in fields.

Alaska is making heavy demands on the markets of Portland for potatoes, buyers paying from $1.10 to $1.25 for strictly fancy stock.

Cash premiums to the amount of $20,000 are to be given in the Pacific National Live Stock Show to be held at Portland September 21-26.

Phoenix, Ariz., Board of Trade is making an endeavor to get together an exhibit to be made at the National Irrigation Congress at Albuquerque.

Anticipating the opening of government land near La Grande, Ore., nine men began standing in line before the land office, twenty days in advance of the opening.

Owners of land under the Prosser Falls Land Power Company System at Prosser, Washington, will ask the government to take charge of the work of putting the land "under water."

Mrs. Dimick, an onion set grower at Hubbard, Oregon, has 300 acres of farm land, of which 8 acres are in onion sets. These 8 acres produce more than all the remainder of the 300 acres.

Southern Oregon is now having active business in its handling of the prune crop. Packers are offering 5 cents a pound for 30 to 35s, with a quarter of a cent less for each additional five prunes. This price is quoted by all packers.

Apple growers of the northwest have been compelled to pay an increased freight rate on their apples to all eastern points. The former rate from the Willamette Valley was 80 cents; on the thirteenth of this month the rate will be $1.00.

The greatest array of high-bred stock ever gathered together in the Northwest is promised for the fair circuit of the Northwest this fall. The circuit starts on September 7 at Seattle with the Western Washington Fair; next is the Oregon State Fair at Salem, September 14-19; Pacific National Show, Portland, September 21-26; Washington State Fair, North Yakima, September 28 to October 3; Spokane Interstate Fair, Spokane, October 5-10; Western Washington Fair, Walla Walla, October 12-17. At these six expositions there will be $100,000 in cash premiums for live stock.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

PREVENTION OF ROUP.

YOUNG stock from two to six months of age is very susceptible to roup, and all precautions should be taken to prevent these young birds from contracting the disease during this period. First, they should be protected from conditions that tend to produce chills, as overcrowding in the brooders and houses; by this means they become heated and the cold and damp of early morning chills them. They should be provided with plenty of good air without direct drafts.

They should not come in contact with roupy fowls or be yarded on ground where roupy fowls have been recently. They should be kept free from lice and mites, as these pests tend to weaken the vitality. Use a disinfectant in the spray that is used in the houses, thereby not only killing lice and mites, but also the active cause of roup and other contagious diseases.

The drinking water at this time should be carefully attended to; water should be kept in clean dishes and protected from the sun. And it is well where there is danger of roup and similar diseases to use a disinfectant in the drinking water. I know of nothing better than Douglass mixture. I like it better than bluestone or carbolic, as it not only acts as a disinfectant, but also as a tonic, while the others have not this virtue.

The poultryman should direct his efforts toward the prevention of this disease rather than treatment after a flock has become infected. A bird that has once suffered from an attack of roup will never be a profitable fowl. It delays development, retards egg laying, and the bird is liable to infect other members of the flock for a long time. Infected birds should be killed and houses and runs disinfected, and the greatest care exercised to prevent the spread of the disease. Roup probably causes more loss to the poultryman in California than all other diseases combined. If a place has become badly infected, it is better to keep fowl off for a year.

POULTRY BREVITIES.

More chickens die from overheating than from cold.

* * *

There may be profit from a hen more than two years old, but if so she is an exceptional hen.

* * *

Feeding dry mash in hoppers saves much labor, and the results are as satisfactory as when the hens are fed three times a day.

* * *

Eggs with brown shells are no richer as food either in flavor or composition, than white-shelled eggs, although there is a popular idea that such is the case.

* * *

Chicks as a rule should be fed often. After chicks are six weeks old, they may be fed the same dry mash fed the mature hens, providing this is a suitable one for growth and egg production.

* * *

Hopper feeding helps materially in having the pullets mature uniformly. Every pullet gets all she wants to eat, and the stronger ones do not gorge themselves as when fed at stated intervals.

* * *

One part wheat and two parts corn mixed and cracked at the mill a little finer than ordinary cracked corn, and to this add 10 per cent. of fine beef scrap. The above combination makes an excellent chick food.

* * *

Possibly Poison.

My hens are dying with peculiar trouble. One day they seem well and the next morning some will be found dying. They stretch their necks to full length and they seem to try to swallow, then draw head between legs while wings droop. They have full range in field of wheat. Feed nothing else.—A. B. C., Laton.

I am unable to say what the trouble is with this flock. The general symptoms hint to some form of poisoning and might come from eating the carcass of a decaying animal. Ptomaine poisoning is not uncommon. In such cases I look around carefully for some cause of this nature. Shut the hens up for a time and if no cases develop you may feel sure it was due to causes included above.

* * *

Roup.

My turkeys are troubled with a swelling along the bill under the eyes. What is the cause and what can be done for it?—M., Elsinore.

The swelling below the eyes in these turkeys is a result of roup in some of its various forms. If these swellings are opened they will be found filled with a cheesy mass; press this out and wash the wound with an antiseptic solution. Peroxide of hydrogen or a solution of carbolic acid made by adding a tablespoonful of acid to a quart of water answers the purpose. A small rubber syringe costing 25 to 40 cents is excellent for washing out the wound. Examination will probably show the presence of roup in the flock, but frequently the bird has recovered from the active form of the disease and this swelling is left as a result.

* * *

Teaching Chicks to Roost.

I have about 150 Barred Rocks chicks hatched in an incubator. They are now some ten weeks old and are causing us much trouble by bunching together on the floor of the pen crowding into corners and together. We have lost 25 or 30 in this way; there are roosts in the pen but they will not sit on them. What shall we do to teach them to roost?—E. R. H.

When chicks do not take to roost at a suitable age of their own accord they must be taught to do so. The easiest way to do this is to put them with two or three older chicks that have learned to roost; the younger birds will, as a rule, follow the example of those that go to roost. Another method that works successfully is to place a board 8 or 10 inches wide close to the wall and just far enough from the ground so they cannot get under it. When they find they cannot get under the board they will naturally get onto it and if they have been accustomed to crowding into the corners the tendency will be to extend the group along the board. A little time spent in helping this movement will pay. After the chicks get into the habit of sitting on the board gradually raise it until it is a foot or more from the floor and bring it out from the

wall far enough so if they crowd back they will fall off. They will soon learn to stay on the board. Then take board away and put one or two flat roosts three or four inches wide. They will be awkward on these at first but after a little will be roosting on them without difficulty. It is well to shut off all corners by placing a board across them, for if they crowd into these they pile up and smother each other.

* * *

The Molting Period.

At the present time everybody is interested in problems connected with the molting period. The following from the pen of L. E. Keyser in the Western Poultry Journal will be of interest:

Yearling hens make profitable winter layers if they molt early and quickly. If a hen molts and comes to laying in sixty days she will be as profitable as a pullet, even though she lay but seventy-five per cent as many eggs. It takes five months to grow a pullet, so there is three months' feed and time saved. I do not think it a good plan to dispose of all the yearling hens. If they are slow to molt or such as are undesirable, then they should be sent to market, but a hen which has produced a good supply of eggs during the past season will in all probability do well after the molt, providing she molts early. By watching our hens carefully we will have no trouble in determining which to choose for winter layers.

Hens which show no signs of molting by the middle of August can be assisted. My method is to pen them in a house with a small yard and reduce the feed. At this time I feed wheat only, giving one feed a day, at the rate of two quarts to fifty hens. This is kept up for a week or ten days, until all have ceased laying and become quite thin; then, if when plucking a few feathers we find they come out easily and no blood adheres to the quills, we let them out on a good grass pasture (alfalfa or clover is the best) or supply them with all the succulent green food they will eat. The feed of wheat is given in the morning and is gradualllly increased, while at night a mash of mill products and beef scraps rich in protein and ash is fed. Very little mash is given at first, but the quantity is increased each day until at the end of a week they are given all they will eat. The feathers soon drop off, new ones appear, and in from forty to sixty days the flock will be through the molt and back to laying again.

It is an open question whether it is more profitable to force the molt as above described, or allow the hens to take their own time at it. If the hens are laying well we can, by heavy feeding, keep up the flow of eggs and at the same time give the hens material for a new coat of feathers. It will take the hens an average of one hundred days to complete the molt and get in laying form, but during this we will be getting some eggs. By this process our hens usually average about a dozen eggs per day from a pen of fifty. Not all the hens lay continuously, but there are enough laying to keep up this average.

Hens molted by the quick process will probably lay more eggs during the winter, but not quite so many in the spring as those allowed to molt in the natural way. I think there is very little difference in the number of eggs the hens will lay in the next ten months whether molted by one process or the other. With the slow molt there is less danger of loss. Hens to be molted by the quick process should be strong and vigorous and free from lice. Weaklings are very apt to succumb.

This Roofing is Proof Against Rain, Sun, Snows, Winds, Storms and Fires

"The fire started on the roof."

So most newspaper reports show.

Most roofing materials, like tar, shingles, etc., catch fire like kindling wood. Often, just a spark from a chimney sets them ablaze.

But you can put a red-hot coal on Rex Flintkote Roofing, and it won't ignite it.

That's pretty positive proof that Rex Flintkote Roofing won't catch fire.

The sun soon warps shingles and softens tar-roofing.

Rains and snows soon rot those same shingles and soon soak through the tar-roofing.

Winds and storms play havoc with both these kinds of roofing, and with tin-roofing, too.

But nothing of the sort can happen to Rex Flintkote Roofing.

It is absolutely water and weather-proof under all conditions.

REX FLINTKOTE ROOFING

In the heaviest downpour, not a bit of moisture will penetrate it. You can test its water-proof qualities by putting the sample which we'll send you under the faucet or pump-spout and let the water run as long as you like.

The sun won't soften it or cause it to run, as tar does. It won't crack in cold weather nor curl in warm weather.

It lays absolutely flat and tight, hence winds and storms can't blow it loose.

Because water, weather and wear-proof, it will outlast any other known roofing material.

And it's easiest to put on—goes down like a carpet—any man with a hammer can lay it. It saves much of the expense of laying other roofing.

If you'll write us we'll send you free samples to test. Also an interesting book about roofing.

"Be sure to "Look for the Boy."

RAISING THE GUINEA FOWL.

People who have made a close study of the guinea fowl say that to get the best results in hatching one must keep as many males as females. However, these fowls are somewhat of the nature of geese and one male has been known to mate with two hens. The laying season generally begins in May and extends to August. A good hen should lay about 100 eggs during that time. Being of a roving disposition and naturally shy, they often come to a sad end, with little profit to the owner, when left unconfined. They hide their nests in grassy rock heaps and brush piles when thinking of sitting, and if it be known to them that the nest has been discovered they immediately leave it and seek a new one.

I have seen guinea hens that seemed to care little for their eggs, dropping them wherever they may chance to be. If one wishes to make a business of raising guinea fowl for market, he should enclose a piece of rocky ground with poultry wire and fill it with rubbish—old barrels, boxes and broken pieces of furniture. Let the grass, weeds and underbrush grow at their will and your guineas will enjoy their yard as a goat does his tin can. A common hen is a much better mother for the young guinea than is the guinea hen, as they are more careful of their young.

When the guinea has made her nest, and you have found it after she has gone to roost, never take out all of the eggs unless you wish her to build a new nest. If five eggs are left in the nest, all of the others may be taken. If the yard is not large enough to satisfy the birds their wings may have to be clipped in order to keep them in, as they are capital on the wing.

In the New York market there has developed quite a demand for young guinea fowl for broiling. There is a small but steady demand for the adult fowls also. Most of the stock is sent to market with the feathers on, the killing being done by sticking in the mouth.

June is the best time for hatching, as the chicks are very tender and are easily chilled. It requires from 20 to 30 days for incubation and the young fowl can be gotten ready for market about the first of November —Pennsylvania Farmer.

SHORT COURSE IN POULTRY.

Much interest is being shown in the course in Poultry Husbandry to be given at the University Farm at Davis from October 12th to 20th.

Professor Jaffa has been connected with the university for many years and has made an especial study of feeding problems. He is at the head of the poultry work of the Experiment Station at Petaluma. Mrs. Basley is well known throughout the state through her lectures at Farmers' Institutes on the care and management of fowls. Mr. Huntley is foreman of the Petaluma Poultry Station, and will instruct in judging fowls.

The all important problem of poultry diseases will be handled by two well known veterinarians: Dr. Haring is assistant veterinarian to the Agricultural Experiment Station, while Dr. McNair is a practicing veterinarian of Berkeley, and was at one time instructor in the poultry course at Cornell University.

Is Your Dog or Cat Sick?

You may lose your valuable dog or cat at this season of the year, when a simple remedy would effect a cure. We have that cure in the Celebrated CLAYTON'S DOG & CAT REMEDIES. In short, we have a cure for all ailments that "Fido" and "Tabby" are heir to.

Write for treatise on diseases of both. It's FREE.

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. ***Wm. Starbuck & Son, Fullerton***

Trap-Nested White Wyandottes

That won 22 ribbons out of 25 and 6 Silver Cups and a carving set and a cut glass vase. All the National White Wyandotte Club Ribbons. Second on 10 pullet pen, contest open to all breeds. Mammoth Bronze Turkeys, winners of 5 blue ribbons, all at Los Angeles County Poultry Association Show, December 7, 1907. White Wyandottes were judged by H. Berrar of San Jose, Cal., and W. W. Browning of Ogden, Utah. Hens and Pullets, $15, $20 and up.

TURKEYS ON THE FARM.

On a large farm with buildings centrally located the turkey crop is one of the most profitable; but with a small farm, a neighbor's garden or corn field in close proximity, and a flock of neighboring turkeys ready to induce your own to ramble, no better incentive to neighborhood quarrels can be invented.

The mammoth Bronze is a favorite variety on account of its large size and hardiness. It is claimed to be a cross between the Mexican turkey and our own wild turkey. Certainly it retains several characteristics proving its wild ancestry. Some prefer to cross the Bronze gobbler with the White Hamburg hen, claiming thereby to gain in size and hardiness, and yet retain the more domestic habits of the White Hamburg; but this, like all other cross breeding, is sometimes more successful theoretically than when put into practice; mixing breeds, especially when done by the amateur, is considerable of a lottery.

The turkey hen is a model mother. However, it is usually considered economy to give the first clutch to hens, and thereby induce the turkey to soon commence laying again. Her first eggs are usualy deposited before freezing weather is over, consequently should be gathered daily and kept in a cool dry place until a sufficient number are obtained to employ a hen; seven or nine eggs are about the limit for the average sized hen to cover. The second clutch should be given to the turkey to hatch.—Exchange.

VEGETABLE STIMULANTS FOR HENS.

Green onions and green peppers are powerful aids to a full egg basket.

We plant the onion seed in rows, quite thick, and pull out the young onions in between when large enough.

When the onions are sufficiently thinned, we begin at one row and cut the tops. By the time the last row is reached, the first row is ready to cut again.

Two packets of onion seed and two dozen pepper plants will keep a flock of thirty hens in a healthy state all the year.

The onion tops are chopped fine and mixed with the soft food that is given to the chickens every morning. This food consists of scraps left from the table mixed with boiling water and thickened with bran; the onions are then stirred in. It is given hot every morning, and fully repays the time taken to prepare it.

The pepper seeds are sown in boxes early in the spring and transplanted to the open when the weather permits, Very rich soil and an abundance of water are necessary.

By the time the onions are declaring a strike, from the constant cutting, the little peppers are big enough to use; chop them also. As autumn comes on the peppers become fiery, and this is just what molting hens seem to need.—The Farm Journal.

The sex of the future chicks can not be distinguished by examination of the eggs. Round eggs, pointed eggs and other so-called indications have been tested hundreds of times, not only by experimenters, but also by poultrymen and farmers, the result being that nothing is known in advance of hatching, so far as the sex is concerned. Mating birds of different ages has also been a subject of experiment in controlling the sex, but no satisfactory results have been obtained. Eggs for hatching should be kept on racks in a cool place, and turned round three times a week until used under the hen. They should hatch, even if kept a month.—American Stock Keeper.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the EGG FOOD during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes COULSON'S IMPROVED MASH EGG FOOD and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

The Ornamental Garden

BACK-YARD GARDENS.

THERE are few home makers who have not at one period or another come in contact with that most difficult of problems—the unsightly back yard. With its gaping fence, its vigorous growth of weeds and most frequently its share of rubbish and litter, it seems to defy any attempt which might be made at its improvement. More than one discouraged matron has abandoned the back yard to its fate, leaving it the one eyesore around an otherwise attractive home. Yet there is no reason why this spot should not be made pleasing and even beautiful, if the secret of so doing be possessed by the owner.

The first step needs no directions, for it necessarily consists of clearing away the rubbish and litter which have accumulated through the years of neglect, and which would prove effective obstacles in the way of plants and flowers. When this is done, however, and the space presents a tidy appearance once more, the real difficulty presents itself. The yard is clean, but it has a bare, uninviting aspect, which ill accords with the velvety lawn, with its gay flowers, which fronts the house. Vegetation of some kind must take the place of the luxuriant crop of weeds recently removed, in order to really accomplish the reclaiming of the back yard.

Which Flowers?

Upon the space, as well as upon the amount of sunlight that it gets, the choice of flowers depends, although there is one rule which might be invariably used to govern the selection. Plant only those flowers which are hardy, profuse bloomers and easily cared for, as lack of time, perhaps, more than anything else, is responsible for the condition of the back yard.

Old Fashioned.

A very pretty idea, and one which cannot fail to give satisfaction to the owner, is to make of the back yard an old-fashioned garden, where the flowers popular a century ago may bloom. Petunias, marigolds, nasturtiums and a number of others will adapt themselves admirably to the back-yard garden. Not only will they bloom in the shade, but from early summer until the frosts they will flower continuously, keeping the garden bright. Then, too, they fit themselves to the space, showing to equal advantage in the most diminutive plat.

For a small space, bulbs are not to be particularly recommended, unless, of course, time is not an object to the maker, as while they promise early bloom, they last but a short time and require moving, if other flowers are to take their place.

One Plan.

If space permits, a tiny walk, intersecting the garden and bordered on either side by sweet alyssum, or with any of the low, prolific bloomers which adapt themselves to this purpose, should by all means be included in the garden plan. Besides the alyssum, a row of taller plants with blossoms of a contrasting hue render both the border and themselves more effective.

Equal to Front.

There is no reason why the back door should be less attractive than the front entrance. There are many ways in which its appearance might be improved, but none more effective than the tiny trellis which shades and beautifies the doorway. Over it may be trained one or more of the numerous varieties of vines, which are particularly adapted to trellises. Clematis Paniculata, a beautiful and well-known one, possesses decorative value, not only for its glossy, dark green foliage, but for its fragrant white blossom. The Mexican or Mandarin vine, known by names as numerous as the colors of Joseph's coat, are rivaled by the humble morning glory, scarlet runner and climbing nasturtium vines in the back-yard garden.

Harmony and simplicity are the combinations to be sought after in the garden. And the last-named vines harmonize perfectly with the annuals which are most suited to the back-yard garden.

Some Vines.

Trained against the fence or the side of the house, the vines make a pretty background to the bit of gay coloring of the flowers.

In a Salem back yard, where the tiny space allotted scarcely deserved the name, the treatment used was worthy of notice. No front piazza was had, and no room for the building of one was available. Therefore, the bit of yard hemmed in on either side was given a flooring of boards, against the wall were trained morning glory and bean vines, so as to give a bit of greenery, and here, on warm afternoons, the sewing basket and rockers were brought, the buildings on either side shading the spot throughout the day. It was a unique plan, which utilized a space where even flowers of the hardiest nature would have found existence difficult.

Cover the Fence.

Another unique little garden, whose principal plants were vines, lay between an old-fashioned garrison house and its newer neighbors, separated from the latter by a high board fence. For its planting, scarlet and white beans were chosen, and though scarce soil enough could be had to cover the beans at their planting, the owner persevered in her task, and later on in the season was rewarded for her labor by a fine lot of hardy flowering vines, which obscured the old board fence and which crept round the windows and doors.

It is such places as these, where there seems scarce soil enough to plant a mustard seed, where long use as a dumping place for ashes has effectually taken all fertility from the soil, that the would-be gardener is taxed to the utmost of her ingenuity. One consolation remains, however, for the plants which will grow in such places are those which require almost no care whatsoever. Vines are the best choice under such circumstances, and the simpler the selection, the better. Morning glories and scarlet runners are primal favorites, and there are several others which are available for just this purpose.

The unsightly spot in the angles of the house are unsightly no more, if covered by the broad leaves of the Dutchman's pipe, and the eyesore which has been a worry and vexation is removed. When space and light permit, by all means, include sweet peas; in the vines they will cover an otherwise ungainly fence, and it is impossible to have too many of them for cutting. The ground which would be impossible to plant in vegetables will furnish bouquets through the summer, and brighten the house as well as the garden.

It Doesn't Cost Much.

Economy is one of the chief objects gained in the back-yard garden. A package of seeds purchased for 5 cents at any store will plant nine square feet of ground, or will cover a wall ten feet in length with vines. In view of this, there is all reason in saying that the garden is within reach of all, both in time and money—two of the most important of the many considerations to be reckoned with.

Give your garden a chance to prove what can be accomplished there. Prepare the ground for the reception of seeds. If the space is large, have it dug for you, though if possible, take the time outdoors and accomplish the work yourself. You will enjoy it, and it will pay you a thousand times in health and strength. Do not try elaborate designs, for it will mean enlarged expense, besides taking more time, and the chances are ten to one that it will disappoint you after all. Instead make the flower arrangements as simple as possible, blending two or three pretty flowers and vines, and giving them plenty of room to grow and spread themselves. This will aid in counterbalancing the disadvantages of shade and poor soil. Give your back-yard garden a fair chance, and see if it does not repay all your care of it, by filling your summer days with brightness.—From Floral Life.

Curing Raisins.

Please give method of making raisins from muscat grapes.— S. H. O., Anaheim.

Allow the grapes to become perfectly ripe and sweet. Place on trays and in the sun and in case of heavy dew or light showers, stack to keep as much from moisture as possible. As they become nearly dry the trays may be kept stacked during the heat of the day also, for it is not desirable to dry too rapidly. With good weather they should dry in from 6 to 8 days sufficiently to turn. After turning watch carefully to prevent too rapid drying, also to prevent becoming too dry and hard. When dried place in the sweat box which will equalize the moisture, the few which may be overdried absorbing moisture from the larger ones that are not yet quite dry enough. Sorting and grading and other commercial factors can be learned only by experience with those who know the business. This in mere outline is the process.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Butter Won't Separate.

Since a cow came fresh a few weeks since I have been unable to separate the butter-milk from the butter. In churning, the butter does not go into little lumps, but simply goes from the state of cream to butter very smoothly. I have churned at five and six in the morning, so as to have it as hard as possible, but that seems to make no difference. I never had this difficulty before she went dry, and was always able to separate it, no matter what time of day or what weather. This morning, after milking, when my husband brought the pail of milk in, there were a few little patches of grease on top of the milk. She is fed stock beets and green corn now.—O. J. L., Bells.

Try the following different ways and one will surely be found to be the cure. Have the cream fully ripened, that is, well on the acid turn. See that the churn is not over full. One third is about all a churn should be filled. Try giving the cream a dash of cold water just when the butter forms. This often liberates the butter from the cream. Milk from fresh cows on all green feeds often shows floating butter, or oil, on the surface. Ten pounds of grain hay or a quart of rolled barley a day will usually end this trouble. Too high a temperature may be another of the causes. If water is put in gallon glass jars and stood outside at night it may be packed away in a hay box early in the morning and hold its coolness all day. The cream can be treated the same way and ripened at sixty or fifty-five deg. and it will churn out all right.—M. E. S.

Peaches Not Coloring.

Our peaches do not color up. What is needed in the soil to give them a good color? Our soil is a sandy foothill loam.—A. L., San Bernardino.

There is nothing practical known that will make your peaches color up if your soil and climate will not do it. You do not name your variety. Some varieties have little or no color any place.

Wraping a wire tightly around the branches will give a higher color and earlier fruit of poor quality.—J. W. M.

Ropiness in Milk.

I have a milch cow that gives as good looking milk as any cow, but after standing until cream rises it becomes stringy and unfit for use. She is healthy and has good appetite and drinks well.—A. B., Arroyo Grande.

Bacterial growth in the milk is the cause of the slime, not the food of the cow. I have known it to be very bad when cows stood in swampy places; as soon as the cows' udders and legs were washed and the animal put on a dry field the trouble stopped. The stables should be swept out aud sprayed with carbolized water or whitewashed. Wash the cows' udder and legs and wipe them with a dry cloth before milking. Wash and scald everything used about the milk. After doing this once, repeat it, using either lime water or salt in the water of the last washing, turn up aud dry, by the heat of the vessel from the water. The temperature must be right for the development of this slime and it sometimes does not appear for several days. The freaky behaviour caused the milk maids in England in seventeenth century and eighteenth century to ascribe the slimy appearance to the night visit of kelpies. and bad fairies.—M. E. S.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Poultry Manure.

We have each week about half a cubic yard of clear fresh hen manure which we wish to use on orange orchard. The trees are about ten years old, fine, thrifty, bearing well. No other fertilizer, excepting horse and cow manure, has been used on this orchard. How much of this hen manure can we use advantageously for each tree, and how best apply it? What is relative value of fresh hen manure and fresh horse and cow manure in which there is but little straw? —E. H., Nestor.

Regarding quantity of manure to each tree, we have referred to Mr. Mills for answer. The answer to the other questions are practically all in Mr. Mills's article on Citrus page in this week's issue of the Cultivator.

Mites.

Something is bothering the tail of my horse, causing him to rub it against posts, etc., whenever he can. Seems to be some irritation, although we cannot discover anything.— L. F., Los Angeles.

Brush the tail out well and rub in, with the hand, lard, working the lard in to the bone all around the tail. This will usually be all that is necessary, and if it is, repeat twice a month and this will keep the bone free from this troublesome irritation. Where the trouble is of long standing, mixing in a tablespoonful of sulphur with half a pound of lard will increase the strength of the mixture. The men always have a piece of bacon rind at the barn and grease anywhere that a mule or horse rubs or bites. M. E. S.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Sun Stroke.

Will you please tell me what to do for a mare that has been overheated. I can't start any sweat ou her. She pants all the time.—H. B., Coachella.

Almost this same query came from Coachella a few weeks ago. Horses seldom recover from sunstroke. If you send her to a cooler climate she will improve some.—R. T. W.

Glanders or Diseased Tooth.

Please tell me what ails my mule. About ten days ago she started to swell on the throat and jaw; runs at the eyes; acts a great deal like distemper. Yesterday I lanced the side of the jaw but nothing came from it except a few drops of blood. She does not eat much and lately she has been slobbering at the mouth and tongue. I have examined her mouth but can find nothing wrong. I examined her eyes this morning; the one on the side affected was much more red or pink than the other. Please let me know through the Cultivator what to do for her.—J. C. J.

The symptoms are suspicious. You should have her tested for glanders. If she proves not to be infected poultice the parts until there is farther development. It may be from a diseased tooth or an injured bone, in which case it will be necessary for you to call on a veterinarian.—R. T. W.

Undeveloped Teat.

I have a very promising heifer about to have a calf. She has three teats well developed and shows to be full of milk, but the fourth one is small and appears to be blind altogether, that is, no milk in it. Can anything be done in the way of opening it to let the milk flow down into it the same as the others? I have been getting her gentle and found this out by chance.—Ventura Subscriber.

If there is no opening through teat, it should be opened with a troca and a milk tube inserted. Keep it in until the milk flows through the teat without its use. Keep the tube corked except at milking time. When the milk flows through teat, the calf will develop it if compelled to suck that one.—R. T. W.

Paralyzed.

What can be done for a mare that is apparently paralyzed on the right side of head, right eye being partially closed, the right ear hanging down, and the upper lip turning off to the left side of the head very decidedly?—W. T., San Jose.

There is no cure. There is usually an improvement for a time, but seldom complete recovery.—R. T. W.

Use of Dilator.

I have before me a catalogue in which is advertised a teat-opener for opening obstructed teats. Are they safe and reliable for hard-milking cows? How far into the teat should they go? This is 4½ inches long.—J. S. M., Upland.

There is more or less danger connected with the use of all dilators, especially if there is any cutting done. The dilation of the openings by the introduction of a probe-like instrument is the safest. The distance depends on the length of the teat, unless it is the end of it that is to be enlarged.

Fistula.

I have a horse. I presume he has a fistula. Has a lump on the point of right shoulder blade. An opening formed within two inches of top of neck. I lanced it before the opening was thoroughly formed. It runs yellowish matter, and around the opening and where I lanced is quite firm. The horse is not lame and has a good appetite. What is best to kill it permanently. Am subscriber to your paper Please let me hear in the next issue. —Jas. Melbourne, Holtville

You have undoubtedy got a fistula now, whatever it was before cutting. My advice is for you to call in the best veterinarian you can get. Your county stock inspector is the man. Otherwise you will save trouble by killing the horse instead of the fistula, as it will probably keep getting worse if it has any depth now.—R. T. W.

Spavin.

Will you tell me what ails my mare? While working her last winter on the four-horse scraper she was stiff when started to work in the morning; later seemed all right. Has been getting worse until am unable to work her. Have not worked for four or five months. Lameness is in left hind leg. Sometimes now walks on three feet. There is no swelling. She does not flinch when any part of leg is pressed No trouble with the hoof.—R. T., Escondido.

From your description I should think your mare has a "spavin," and if you will examine the hocks I think you will see it plainly. Severe firing is the only treatment that is of much use. This will have to be done by some one who knows how or you might make her worse, if it is possible.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Continued from First page.

LAST FAIR IN PAVILION.

her exhibit was at once varied and complete, hardly anything that can be grown being absent. The whole was well displayed and was crowded with visitors. Beside the county display there were a number of exhibits by Los Angeles manufacturers, prominent among them being that of the Tourist automobiles. Other counties represented are Fresno, Monterey, Sutter, Alameda, Sacramento, Sonoma, Santa Cruz, San Diego, Santa Barbara, Butte El Dorado, Glenn, Napa, Tehama, Stauslaus and others.

All of these have made excellent displays and it is impossible, in a short space, to do them justice. A feature of the Napa exhibit, among many good features, was a collection of apples, There was a large display of this fruit including a number of varieties and all of them good. It proved that apples can be grown in California.

A strong and taking feature of Fresno's display was, of course her product—raisins. In the midst of her masses of this fruit, a seeder was kept in operation, and the raisins as soon as they had passed through the machine, were distributed to the spectators.

Not to be outdone by the generosity of Fresno, Stanislaus county on Wednesday presented every visitor to the fair with a cantaloupe, and probably presented some with several, for every one who held out his hand got a melon every time. It was Turlock's day and she will long be remembered in Sacramento for her cantaloupes.

The Alameda exhibit was, as it always is, par excellent. Alameda is at a once a great fruit, agricultural and manufacturing county, and she was well represented in all branches. A special feature here was her preserved fruits and flowers. These were put up by Prof. Nicholos who has a patent process, which will preserve the most delicate flower perfectly, both in color and form.

Educational.

The University had a very large display of cereals, and what perhaps excited more attention and interest than anything else, a display of 29 varieties of eucalyptus wood worked up into various articles of use on the farm. In fact there were several displays of Eucalyptus. One by the State Forester who exhibited a set of parlor furniture made of blue gum wood with other articles made of other species. There is now such interest being taken in this wood that any display of it awakens the keenest interest.

Dairy Supplies.

Another exhibit which was always a center of interest was that of the dairy machinery and appliances, and there were several good ones. The DeLaval Company, especially, had a very large exhibit of separators and all other appliances of the modern dairy In the machinery department there was the usual large display, very much of it being pumps and pumping appliances, most of them in operation. This in California always attracts an audience and these were surrounded by people during the whole show. There were, besides, a number of road making machines, threshing and harvesting machinery, hay balers, and in short, all kinds of machinery called for on the farm.

Sensations.

In addition to the many attractions furnished in the way of music, trapeze performers, etc., those who delight in sensations were regaled with a wedding in den of lions. In order to get up this exhibit a young couple were offered their house furnishings if they would take part. The pavilion was crowded to see the performance which came off as per programme on Wednesday night. The only comment upon it was disapointment that the lions took the whole affair with so much indifference. They did not even look up while the ceremony was in progress.

Stock.

At the Agricultural park in the outskirts of the city, there were some good racing events every day of the fair and the grounds were well patronized.

The stock was an extra good one, the exhibit of horses by Crouch & Son, of Lafayette, Indiana, being an especially fine feature. The beautiful Arabian stallions from the stables of Miss Eleanor Gates, the authoress, were another center of attraction. Los Angeles was well represented on the grounds as in the pavilion and one of the finest displays of Clydesdales and hackneys was that of William McKie. George J. Read, also of Los Angeles, has a fine lot of horses, among them two prize winners. C. E. Lewis, of Antelope, has an exhibit of Percherons, among them a handsome pair of pinto draught horses which attracted attention from all

There were a number of fine herds of Jerseys, Holsteins, and Alderneys but a herd of Dutch belted cattle entered by Mrs. Jenny Strader, of Ceres, with their peculiar markings, was a feature of the grounds. The Glide estate has a herd of twenty-three blooded short-horns, Guy H. Miler of Modesto, has a fine herd of Jerseys, and A. Smith, of Corcoran, has also a fine herd of the same stock.

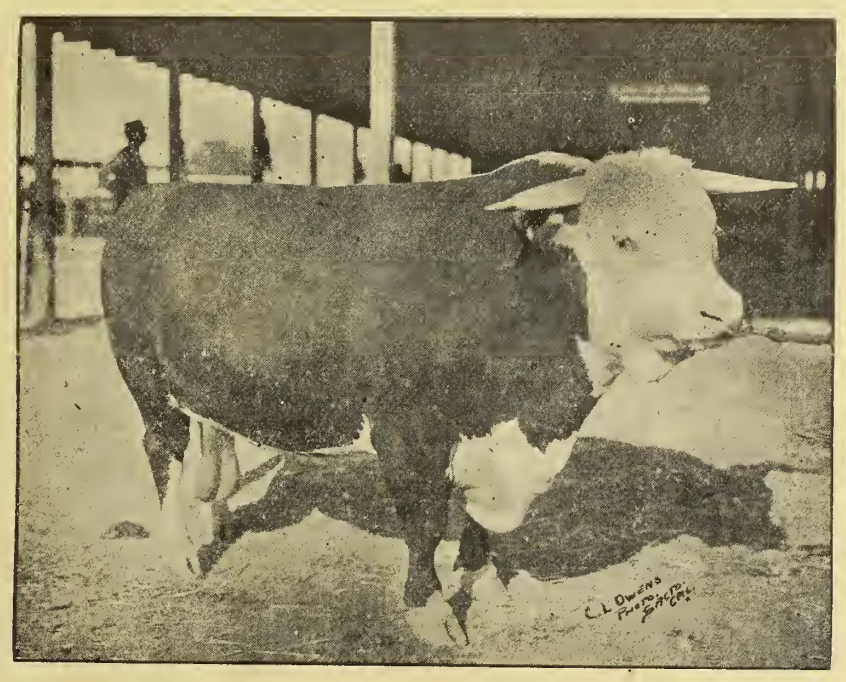
In the line of sheep, the display is not so large as usual; there were, however, some excellent specimes of South downs and Merinos. Baily and Sons of San Jose. had a large herd of Angora goats and the Waite estate of Perkins, Sacramento County, had by far the largest and best display of pigs, largely Berkshires, some of which reminded one of a large watermelon with a peg stuck in each corner.

The poultry display was more than usually good. This is housed in a new building which has been erected for the purpose. It is large, well lighted and roomy, but all the space was taken, and a better collection of birds was never brought together in the state.

Good Fair.

Altogether the state fair this year has come up to expectations. The state has been better represented by different counties which have taken part in it than ever before. It has been a financial success, and the attendance has been large from the opening day. A very large portion of the attendants were from the country showing that the agricultural fair once again apeals to the agriculturists, which it has not done before for years. The management has shown that a good fair can be made without the assistance of gamblers and touts.

This is the last fair that will be held in the old pavilion, as in accordance with the law passed for its removal, the work of wrecking that building will be commenced shortly after the close of the fair, and a much more modern and better fitted structure will be erected at Agricultural Park for the holding of future fairs.



GOLD MEDAL HEREFORD BULL

Fulfiller 2nd, exhibited at State Fair by Paul Clogstone of Clogstone, Idaho, won 1st premium, also gold medal.

SPANISH RAISIN CROP.

Statistician Robertson, who is probably as well informed as any man, comes boldly out with the statement that, in spite of all reports to the contrary, the Spanish raisin crop this year is not short at all. Reports which he has received as late as three days ago, and from reliable source, state unanimously that the prospects for the new crop of Spanish raisins both in the matter of quality and quantity are excellent.

The crop of Sultana raisins at Smyrna is reported to be of good condition, and the quality of the dried product will be up to the standard, but this will be short. The total of the Turkish Sultana crop last year, it will be remembered, was 47,000 tons.

Mr. Robertson says that last year's crop of Spanish raisins was about 27,000 tons.—Fresno Republic.

Fresno capitalists are organizing for the purpose of planting out an immense forest of eucalyptus trees. A $100,000 corporation is to be organized and eight sections of land are to be planted.

The Colfax, Washington, harvest season was the shortest this year in its history.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. R. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles. Cal.

FOR SALE—30 H. P. WHITE AND MIDDLETON distillate engine also centrifugal pump at a snap. 943 N. MAIN ST. LOS ANGELES.

FOR SALE— TWO 5 H. P. GASOLINE ENGINES also one 3 H. P. all in good running order. Can be bought cheap; 117 BRUNO ST. LOS ANGELES.

FOR SALE—COMPLETE PLANTS GASOline, electric and steam machinery of all kinds, new and second-hand bought, sold and exchanged. See us before buying. We can save you money. BAILIE & BRANDT CO., 943 N. Main st. Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

ORCHARD HOMES FOR SALE—FIVE acres and upwards; fine citrus and deciduous fruit lands on easy instalments and low interest. Write us today. Wyatt & Wilson, WINTERS, Cal.

POULTRY

BUFF ORPINGTONS—WOULD YOU LIKE the very best at the price of common stock? Sullivan's COMMONWEALTH STRAIN you may have at HALF PRICE FOR THE BALANCE OF THE SEASON. Write us and learn the reason; get record and illustrated catalogue FREE.—MR. & MRS. W. S. SULLIVAN, Agnew, Santa Clara Co., Cal.

FOR SALE—STOCK OF THE FOLLOWING standard bred varieties of poultry, Black and White Orpingtons, Brown and White Leghorns; won fourteen first and second prizes on fifteen entries, State Fair, 1908. J. J. VERKOUTEREN, Route 3, Hanfoord, Cal.

EGGS FOR HATCHING.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

INCUBATORS.

FOR SALE—ONE 360 EGG MUST HATCH incubator, $20. One 220 egg Royal incubator, $10. J. STITH, SANGER CAL.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

SITUATIONS WANTED.

WANTED—A POSITION AS FOREMAN OR manager of orchard or ranch property, by a progressive young married man. Good recommendations. Address E. R. O., care of CULTIVATOR.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

WANTED—ORDERS FOR EUCALYPTUS trees for spring delivery. Write for prices. Seed of the Rostrata and Sugar gum for sale. ENCINITAS FLORAL & PRODUCE CO., Encinitas, Cal.

PIGEONS.

OUTCLASSED.

Everybody's kickin',
  Kickin' 'bout the heat;
Kickin' 'bout the prices
  We pay for things to eat.
Kickin' 'bout the railroads
  An' the government;
Kickin' 'bout the taxes
  An' the way they're spent;
Kickin' 'bout the autos
  An' the pace they set;
Kickin' 'bout the grafters
  An' the pull they get.
Old mule looks dejected,
  Says in tones demure,
"When it comes to kickin'
  I'm an amachoor!"

—Washington Star.

CHRYSANTHEMUMS.

SHE was kneeling just inside the fence, stirring and patting the already prepared soil of a flower bed with a pearl-handled trowel, ordered especially for this first summer in the country. And as she stirred and patted her lips murmured a few bars of a French labor song, and her brow wrinkled and smoothed with the trowel. She was pretty, with the winsome clinging beauty of the vine.

Presently she surveyed her work critically, approvingly. Certainly it was very nice and artistic. All it lacked now was the flowers.

As she raised her eyes she looked straight into a pair of admiring ones on the opposite side of the fence.

The man's gaze was averted instantly and he would have passed on, but she stepped to the fence with a pretty, impulsive gesture.

"Aren't you Mr. Ware of the next cottage beyond?"

"Yes."

"Well, I've been admiring your flowers," frankly, "and—yes, I may as well confess it, I was in your greenhouse yesterday and spoke with your gardener. He said you had the finest chrysanthemums in all the country round last fall—prizetakers, and all that."

"Yes, I had some very fine ones I believe," he answered, smiling back at her.

"How lovely!" clasping her hands. "I dote on chrysanthemums. My latest ball gown is figured with them. Will you tell me where I must get the prize flowers, and would I better plant them or just stick one side in the ground for—for slips—isn't it slips they're called?

"Why, no; I'm very sorry, but you're mistaken," he answered admiring the delicate color which came and went in her face, and glad to know that the face belonged to the next cottage. "You see, it's bulbs. My gardener had a great box full come the other day, and he's so choice of them he'll scarcely let me go near the box for fear I'll get something mixed."

"Oh, that's it," in a relieved voice; "I didn't know, but it's lovely. If they're bulbs there won't be any wilting. But where shall I get them?"

"If you will permit me," eagerly, "I will be only too delighted. My gardener shall bring them over and plant them for you himself."

"No, no," she prostested, "not that. I must do the work. It's to be my penance for frivolity last winter."

"Of course," he agreed. "Well, suppose I don't say anything about it to the gardener? I will pick out some of the handsomest and bring them over myself and—help plant them. May I?"

She looked at him thougbtfully.

"Why, yes! I don't know but you may," she answered. "You can tell me how."

"And do the digging," he supplemented. "I will put on gloves. It will be so droll and—and nice."

"And I think I've heard of you in New York at—at—"

"The Manhattan?" inquiringly.

"Yes, very likely it was the Manhattan. I'm Miss Richardson of Forty-second street."

"Who visits a Miss Trelawney—Olive Trelawney?"

Her hands came together in pleasant surprise.

"Do you know Olive? Why, she is one of my dearest friends."

"Indeed! Isn't it delightful? My sister knows her, and has heard her speak about Miss Olga Richardson. Really it seems that we are old acquaintances after all. I wil get the chrysanthemum bulbs now and hurry back."

"Certainly, it will be lovely."

Ten minutes later he was back, bringing as many large, plump bulbs as he could carry, and with delightfully profound remarks on the art of gardening and the usefulness of labor, they kneeled on opposite sides of the trowel-carved bed and planted the bulbs, one by one. As the last tuber was receiving its covering of soil a deprecating face appeared at an opening in the shrubbery.

"Av ye plase, Sorr," an anxious voice called, "have yez been afther seein' any b'ys or tramps lurkin' about?"

Two or three last pats were given to the little mound which covered the bulbs, then Mr. Ware turned.

"No, Michael, not this morning," he answered. "Why?"

"Because some rapscallion's been sthalin' the pertaties I put aside for plantin'. They was in a foine noo basket—" He stopped suddenly, adding: "I beg pardon, Sorr!" and disappeared behind the shrubbery.

The "foine noo basket" stood beside the newly-planted flower bed, empty. —Spokesman Review.

HOW TO RESTORE LEATHER.

To clean and restore the kind of leather that is used on furniture:

Dip a soft woolen cloth in boiling milk and wipe the leather with it, rubbing gently until all the dirt is removed. Then wipe the leather dry with a soft flannel. When it is clean go over the surface with a piece of flannel on which is spread a thin layer of prepared wax about as large as a pea. After waxing, go over the leather with a clean flannel, rubbing briskly but not too hard.

For the wax, cut two ounces of beeswax into small bits and put them in a bowl, place the bowl in a pan of hot water on the back of the range.

When the wax is soft take it from the fire and beat into a quarter of a cupful of turpentine and half a tablespoonful of paraffin oil. It should now be used, but if it becomes cold before you are ready to use it, put it in a pan of hot water and let it stand for a few minutes.

Ordinary black leather, such as is used for covering books and handbags, if it has become faded or discolored, can be restored with a fine quality of shoe dressing.

"What is the universal desire?" asked a seeker after truth. "Something to worry about," answered a plain citizen, not without careful thought.—Pittsburg Post.

FARMERS' BOOKS
Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

RASPBERRIES AND BLACKBERRIES.

Raspberries, both black and red, are not only especially valuable for canning and preserving, "more valuable than even the delectable strawberry," as one authority says, but easily adapted to a variety of agreeable forms of dessert. To begin with, they make an excellent shortcake, but this is true of many other fruits not commonly offered in that way. Blackcaps, in particular, served in a shortcake with a rich berry sauce are most satisfying. This special shortcake of black raspberries deserves to be better known.

Raspberry Shortcake.—Sift two cupfuls of flour with two teaspoonfuls of baking powder twice and rub into it thoroughly two large tablespoonfuls of butter, with a pinch of salt and a dessertspoonful of sugar. Mix quickly and lightly with a cupful of cold water. Divide into three parts and roll out each to the size of an ordinary layer cake. Bake in a quick oven. With light handling the result will be an extremely light, creamy shortcake. Spread each cake while hot with a little sweet butter. Have ready a quart of fine black raspberries, crushed by rubbing with the back of a silver teaspoon, and well sprinkled with sugar. Prepare these before baking the cake and use them to put together while warm, covering the top layer with a few fresh berries. With another supply of berries make a syrup by pressing through a sieve or fruit press and sweetening to taste. By scalding the berries with sugar a somewhat different flavor may be had, but the fresh fruit juice has its own merit. This is a reliable receipt for shortcakes in general, and good with rhubarb, oranges, strawberries or peaches. Cream in addition is to be a matter of individual choice, but not needed with the black raspberry.

Raspberry Cream—Beat the yelks of four eggs very light; add a cupful of sugar and beat again until smooth. Mix with it the juice and grated rind of a lemon and the juice pressed from a quart of red raspberries. Scald together in a double boiler. Whip into the mixture, when taken from the fire, the whites of the eggs beaten very stiff with half a cupful of powdered sugar. Serve very cold in glasses.

Farina with Berries—Farina or any other delicate cereal is very good cooked with raspberries or blackberries. Put the pulp and juice through a press to take out the seeds, sweeten to taste, and add to the farina when partly cooked. Eat with cream, either warm or cold,

These berries are also available for a good use with rice. The rice cooked separately with milk, sweetened, and flavored with lemon, may be arranged in a border and filled with the fresh fruit, sprinkled with sugar. Cream is, of course, the best addition. Tapioca gives another good form.

Raspberry Mousse—Crush a quart of raspberries and cover with two cupfuls of sugar. Soak half a box of gelatine in a cupful of cold water, then dissolve with another cupful of boiling water, stirring over the fire. Put the berries through a strainer and mix with the gelatine. When cooled and beginning to thicken, whip in lightly a quart of whipped cream. Put in the freezer, or freeze by setting in ice and salt without turning.

Raspberries and currants make an excellent combination, whether for a dessert, breakfast fruit, or in jelly. Red raspberries with lemon are improved for many purposes. Lemon is also good with the sweeter blackberries. With a pure, frozen cream, these are excellent mixtures, and a little preserved ginger also goes finely to give heightened zest.

Blackberry Pudding—Beat two eggs thoroughly, add two-thirds of a cup of thick cream from the cream jar. Make a cake with this and a cupful of sugar, one and a half cupfuls of flour, sifted with two teaspoonfuls of baking powder and a pint of blackberries. As the berries differ in juiciness, add a little more flour if the mixture is too soft, and a good pinch of salt. It should be of a firm, light consistency when baked. Eat warm with a liquid sauce, which may be of blackberry juice, strained, sweetened, and slightly thickened with flour or corn starch.

Raspberry drop cakes may be baked on a griddle, mixing the fresh berries with a good batter of an egg, a cupful of flour, and a cupful of milk, and a teaspoonful of baking powder.—Country Gentleman.

TO EXTERMINATE ANTS.

Of all the insect pests which trouble the housekeeper there are none that are so difficult to deal with as these interesting little creatures. To understand the difficulty of exterminating either the black or red ant, one must know something of their habits. Here is a brief outuline which will aid the housekeeper in carrying out a successful plan for the extermination of these pests: Ants live in colonies and are divided into males, females and neuters. The neuters do the work. The males and females rarely leave the colony. The swarms of ants that appear in the house are composed of neuters. The destruction of these ants will lessen the nuisance, but the insects cannot be exterminated in this manner, for others to replace them will be produced in the colony. The colony or nest must be found and the males and females destroyed. This is a difficult matter, and it is only by patient watching that one is able to follow the ants to their home. The colony may be in the soil outside the house, in which case it is easily found; or it may be in the walls, or under the floors of the house, where it is more difficult to reach them.

To exterminate ants trace them to their home. To do this it may be necessary to remove parts of a floor or the baseboard of a room. Wherever the nest is found such measures must be taken as shall kill all life in it. If the nest is in the house saturate it with kerosene oil or with boiling water. If the nest is in the ground have a long sharp-pointed stick, which press into the nest, remove quickly, and pour about two ounces of bisulphide of carbon into the hole; close at once by pressing the foot on the hole. Proceed in this manner until six holes are made, filled and closed. The fumes of the bisulphide of carbon will penetrate to every part of the nest, destroying all life. Be careful not to breathe the fumes of the chemical and be very careful not to have light or fire near when using it. A lighted candle, cigar or pipe might cause an explosion.

Ants may be trapped in either of the following two ways: Cover plates with a thin coat of lard, and set them in the places infested by the insects Place little sticks at the side on which they can mount to the plates. When the plates are full drop them into a pan of hot water. Or, wet sponges with sweetened water and place them about. When full of the insects, drop into hot water.

Strong odors will sometimes drive away these pests, but, as a rule, one does not want to use such odors where there is food. Among the odors that may be used are oil of pennyroyal, oil of cedar (a few drops put on bits of cotton, which are then placed in the infested places,) or gum camphor

To protect food, keep it as much as possible in closely covered tin boxes, or in the refrigerator, or on tables which are protected by having the legs placed in four dishes, in each of which there has been poured some tar water, to a depth of about four inches.—Ladies' Home Journal.

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Exclusively a Savings Bank whose policy is for ***Conservatism*** and ***Safety,*** the result of ***50 years experience.***

Deposits may be made and withdrawn by mail.

San Francisco Savings Union

Founded June 18, 1862 Northwest Cor. California and Montgomery Sts., San Francisco

Conducts a Savings Bank Business Exclusively

Capital Paid Up, $1,000,000.00. Surplus, $1,183,632.06.

Total Assets, $27,508,850.00.

RECIPES.

Sweet Cucumber Pickles.

An old cook book gives the following simple recipe: Take a small crock of pickled cucumbers; then make a rich syrup of New Orleans molasses, cider vinegar and whole cloves. Heat the molasses, vinegar and cloves and pour over the pickles, and in two days you will have a delicious, brittle sweet pickle.

Peach Pickles.

Use either clings or very firm freestones and for one gallon of pared take one pint of the best vinegar and two pints of sugar. Boil the sugar and vinegar to a syrup and drop in the peaches a few at a time and cook until tender, then lift out carefully. After the peaches are all cooked boil the syrup again, and if not sweet enough add another pint of sugar. A little stick of cinnamon and a very few whole cloves tied in a thin cloth should be boiled in this syrup. When the syrup is thick enough, put in the peaches, let come to a boil, and seal while still hot.

Use this same formula for pears, but just before the pears are put in the can, after the second heating, stick three or four whole cloves in each pear. They give the pears a delightful flavor.

Chow Chow.

1 peck green tomatoes, 1 peck ripe tomatoes, 3 heads cabbage, 10 small peppers, 12 onions.

Chop fine, add one cup of salt, and drain over night. Then take 2 tablespoons white mustard, 2 tablespoons black mustard, 2 tablespoons celery seed, 1 tablespoon mace, 1 tablespoon ground cloves, 1 tablespoon ground cinnamon.

Mix thoroughly with the chopped vegetables, cover with good vinegar and simmer for an nour.

HOMELY HINTS.

Hot water used both internally and externally is highly recommended by medical men as a cure for insomnia. Bathing the feet in hot water is particularly efficacious.

For a simple cough cure roast a medium-sized lemon. When hot through cut and press the juice upon three ounces of pulverized sugar. Take a spoonful whenever the cough is troublesome.

To make honey ointment take equal parts of honey and white flour and stir together with a little soft water, just enough to make a thick paste, solid, not liquid. This is one of the good old-fashioned remedies for sores and boils.

If one awakens with cold feet at night straighten out flat on the back and even if the bottom of the bed is cold it will be only a short time before the feet will become warm.

If a blanket is folded and placed on the mattress before the bottom sheet is put on, then folded back over the top sheet it will form a pocket so one can't kick the covers loose at the feet of the bed. This is especially useful in a child's bed.

If one will bathe the feet in cold water before retiring, rubbing them briskly, it will prevent cold feet at night. It will aso warm the feet quickly as it restores the circulation.

Home-made Linoleum.

To make a good home-made substitute for linoleum for the kitchen floor, take any old carpet that is whole but too shabby to use, clean it thoroughly and tack it down smoothly on the floor. Then make a good thick boiled starch of flour and water. Rub a coat of this starch into the carpet with a whitewash brush, and in about twenty-four hours or when the starch is thoroughly dry, give it a coat, and you will have a cheap and durable floor covering equal to linoleum at about one-fourth the cost. By giving it a coat of paint once a year, it will last for years.

TREASUR.E

Lady (to applicant)—"Yes, I advertised for a maid of all work. Are you an early riser?"

Applicant—"Indade, an' Oi am, ma'am. At me last place Oi was up an' had breakfast ready an' all the beds made a fore anybody else in th' house was up, ma'am."—Bagology.

San Francisco offers great opportunities. Prepare for them by taking a course in the San Francisco Business College, 733 Fillmore St., S. F.

The Produce Markets

Hay.

Somers & Company say:

There has been some little diminution in hay shipments to this market during the week ending today, the total showing 3880 tons in comparison with 4350 last week. This lessening in shipments was very timely for had hay continued to come as it did last week there would undoubtedly have been a material decline in prices. As it is there is a somewhat firmer tone to the market and prices are back to the range quoted two weeks ago. The fluctuations in the market have been very regular during the past two months for our records show that one week of heavy receipts and a weakening in prices was immediately followed by a week of lighter receipts and a corresponding recovery in the situation. This has been going on quite steadily and from all indications may continue for the next few months, although in our principal hay districts the fields are well cleaned, yet many out-lying districts have still considerable quantities of hay to be moved for which there is no storage room.

To summarize we would say that for the next few months hay will be shipped to market in moderate quantities with an occasional spurt in prices to be followed by a reaction which will result in an average being maintained at but little above the present range.

A TESTIMONIAL.

A company selling salve sent a quantity to a man, requiring him to write a puff. He wrote that he had a dog that got about two inches of his tail cut off. He applied the salve to the wound and the tail grew out to its natural length. He applied the salve to the piece of tail and a whole new dog grew on.

Citrus Market

LOS ANGELES Sept. 9. 1908.

Valencias are still going forward but at indifferent prices. It is probable that no pronounced advance will be made in prices on the remainder of the crop. The effort will be to distribute evenly, as to time and location, the fruit yet to be shipped and secure the best possible return.

Lemons are also very weak owing to unfavorable weather conditions. Lighter receipts of foreigns will probably stimulate a little better offering.

Shipments.

Shipments of citrus fruits since November 1, 1907, aggregate 28,514 cars of which 4446 were lemons.

NEW YORK, Sept. 3.—Six cars Valencias, one mixed car and one car lemons sold. Market firm on good quality fruit, with an easier tone on ordinary grades. Prices slightly lower. Weather cool and favorable.

RATTLESNAKE BITE.

A California exchange has the following contribution which is a homely enough remedy to be at hand in every home:

"I want to tell you of a simple and sure remedy for rattlesnake bite—one that will accord with physical culture ideas. I saw a young man who was cured and know others who were.

"Take raw onions and salt enough to make them very salty, crush together thoroughly. Apply as a poultice directly to the bite. Remove it when it turns green. Renew frequently until it no longer colors. It is also good for insect bites and stings."

POWER ON THE FARM.

To one who studies the economy of the farm, the need of abundant power is manifest—power that is ready when needed and of a quality within the comprehension of the man who learned to farm rather than run machinery. The day of the large family is passing; in fact, the next census will show a big shrinkage in the husky Jims and Jacks and Joshuas and Toms and Dicks, the old-time lord of the manor was wont to rout out at daylight, each to perform his allotted task before breakfast, and after that meal to hie away to field or forest.

Some of the boys have learned a thing or two and find life "easier" (they think so, at any rate), at work in the city, and the farmer is left shorthanded as they grow to manhood. The gasoline engine or the electric motor is his relief. With either to furnish power for milking machine and separator, the early morning drugery is eliminated. It cuts the hay and saves the waste of loose feeding. It grinds the grain and aids in making the perfect ration. It pumps the water for family and stock, to be used cold when desired and, for the same reason, warmed when needed, for the farmhouse that goes with this machinery is piped for heating also The getting up of the winter's wood, cut for the stoves—back-breaking and soul-destroying job that it was—is more of a frolic when John D. or the juice furnishes the power. There are threshing machines nowadays of a "family size," to be run when convenient, and the throwing of a belt or a switch starts the fanning mill and the huller.

Profit lies in the economy of production and the machine is the economist. There will be big displays of all manner of labor-developing apparatus at the series of state, district and county fairs about to open. He who is wise will profit by them, for the use of this class of machinery leads to a greater benefit; it tends toward a more intensive operation of the land. It helps the owner produce as much on half the area by conserving his forces and its original cost is little more than wages for a year of the help he must hire when the boys leave home.

And better than all these results, there will be less desire for flight cityward by the young folks on the farm that has them.—Portland Oregonian.

FULL AUTHORITY.

A schoolmistress received the following interesting letter from the mother of one of her pupils:

"Dear Miss—You write me about whipping my sun. I hereby giev you permission to beet him enytime it is nessessary to lern him lessons. He is just like his father; you have to learn him with a club. Pound nowledge into him. I want him to get it, and don't pay no attenshun to what his father says. I'll handle him."

GIVING QUICKLY.

"See me next week about it."

"But he who gives quickly gives twice."

"That's just the point. I don't care to be held up later for a second subscription."—Pittsburg Post.

UNUSUAL.

"She is always talking about her mince pies. Did you ever see anything unusual in them?"

"Yes. I saw a shoe button in one once."

Continued from First page.

Stock Exhibits.

Among the showing of high-grade horses first place must be given to the Arabians, owned by Miss Eleanor Gates.

The exhibit of high grade Percheron, Belgian and German coach stallions made by J. Crouch and Son was of special interest. Mr. Campbell, the local manager, is an enthusiastic horseman and an advocate of the highest development of equine aristocracy.

The shorthorn cattle, exhibited by the Glide Ranch, are considered the best in America. They are composed of selections of prize-winning bulls and cows, together with their offspring. This ranch was successful in securing most of the awards in the shorthorn class.

The herd of Jerseys shown by Mr. Geo. A. Smith of Corcoran contains some of the purest blood to be found on the Pacific Coast. Among the more important members are Golden Fern of Oakhurst. He was sired by Golden Fern's Lad, the most phenomenal sire of prize winning and butter test cows the Island ever produced. Sergeant Fox, winner of three championship and three first prizes. His sire, Champion Flying Fox, sold for $7,500 at auction.

Guy H. Miller of Modesto was also in line with some magnificent animals which have records as producers second to none on the Coast.

Sheep.

This exhibit contained some of the best stock on the Coast. It was composed of Spanish Merino, shown by the estate of Thomas Waite; Shropshires shown by T. B. Gibson and G. K. Swingle; Persian sheep and Angora goats shown by C. P. Bailey.

Poultry.

The poultry feature was satisfactory in every particular. There were over 1100 entries by forty-four exhibitors. Contrary to the general rule, Buff Leghorns made an excellent showing both in numbers and quality.

Among some of the prominent exhibitors were Kaufman and Windheim, Nutley, N. J., Rhode Island Reds; J. Cecil, Hanford, 125 entries, including 40 games of several varieties; W. J. Blackman, Los Angeles, white and black Cochins; H H. Holland, Fresno, Brown Leghorns; C. G. Hines, White Wyandottes; John Russell, Brahmas; Mrs. M. C. Plow, Ducks.

Amongst the Prize Winners.

Amongst the thoroughbreds F. H. Burke with Wandering Nun took first prize in the four-year-old class of mares.

In standard trotters, F. G. Kilpatrick won first and F. E. Wright won second on four-year-old stallions. Dana Perkins won first on two-year old stallions and F. H. Burke first on one-year old stallions. On mares four years old and three years old, F H. Burke won both firsts. One-year old first went to E. J. Weldon and second to A. Flores.

Percherons made a magnificent showing and had the strongest competition of any class. In four-year-old stallions, J. Crouch & Son won first, C. F. Singmaster & Sons second, Wm. McKee third. Three-year-old stallions J. Crouch & Son won first, second and third. One-year-old stallions, F. M Welchel won first and E. F. Kleinmeyer won second.

Percheron mares four years old, E. F. Kleinmeyer first; Geo. J. Read, second. Mares two years old, California Polytechnic School won first and second. Mares three years old, California Polytechnic School won first and E. F. Kleinmeyer second. Mr. Kleinmeyer also won first on foals.

Draft horses: Four-year old stallions, Lewis, Terry & White won first and C. E. Lewis second.

Belgian: J. Crouch & Son won all premiums.

Desert Arabians: Eleanor Gates, the authoress, won all premiums.

Cattle.

Shorthorns: Three-year-old bulls, Lizzie H. Glide won first, T. B. Gibson second. Two-year-old bulls, T. H. Murphy first. Senior yearling bulls, Lizzie H. Glide won first, second and third.

Shorthorn cows: Three years old, Lizzie H. Glide first and T. B. Gibson second. Two-year-olds, Lizzie H. Glide first and second. Mrs. Glide also won champion bull and champion cow.

Herefords: Paul Clogstone won all premiums.

Holsteins: Three-year-old bulls, Stanford University; two-year-old- bulls, F. H. Burke first and second. Three-year-old cows, Stanford University first, F. H. Burke second. Two-year-olds, Stanford University first.

Jerseys: Three-year-old bulls, G. A. Smith first and second. Two-year-old bulls, N. H. Locke Company first. Yearling bulls, G. H. Smith first, G. H. Miller second. Three-year-old cows, Guy H. Miller first, G. H.. Smith second and third. Two-year-olds, G. H. Smith first, estate of Thomas Waite second; G. A. Smith third.

Brown Swiss: All premiums won by B. P. Inman.

Dutch Belted: Mr. and Mrs. U. G. Strader won all premiums.

Swine.

Berkshires: Two-year-old boars, G. A. Murphy, first and second; Carroll Cook, third. Two-year-old sows, G. A. Murphy, first and second; estate of Thomas Waite, third. Champion boar and champion sow were both won by G. A. Murphy.

Poland China: Two-year-old boar, M. Bassett, first; T. B. Gibson second. Two-year-old sow, M. Bassett, first: P. H. Murphy, second; W. R. McCaslin, third.

Sheep.

Spanish Merinos: All premiums were taken by the estate of Thomas Waite.

Shropshires: All premiums were taken by T. B. Gibson.

The great fair of 1908 has passed into history, but it has left a remarkable record. It has brought the farming communities into closer touch than ever before and has stimulated effort, inspired ambition, and fostered improvement.

Every farmer, stock raiser and poultryman should attend the State Fair and as many country fairs as possible. They are a benefit to everybody.

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

Kings County Irrigation Waters

OF SPECIAL interest to the uninitiated and of supreme importance to the tiller of the soil in California, is the subject of irrigation. In early days water was the one thing needful. Nature bestowed upon the soil every ingredient which would make for fertility and productiveness, but in a county where the average rainfall is about 9 inches per annum, it is evident that all the natural richness of the soil would be worthless without some guarantee of sufficient moisture to give it life and power. It was a stupenduous task that confronted the hardy pioneers, but that they were amply able to cope with it is proven by the rich verdure, the fragrant bloom to be seen on every hand for twelve months of the year. The lofty Sierras, whose snow-capped peaks stand out against the eastern sky line, have now for many years been the obedient servant of the lowly valley. They give a rich abundance of their store of water, which comes coursing down in lively streams to the thrifty fields, or by slower process, finding its way into the lower depths of the earth, is pumped up to spend itself in the service of man. There are three ways in which this water is available in Kings county, and give to the dwellers here an absolutely constant and reliable supply. First, the surface streams are tapped by large canals that in their turn divide and subdivide and irrigate vast acres of our land. The second means of irrigation is from artesian wells, which tap the streams down in the depths of the earth, bringing up an abundance of fine, soft water for irrigation, drinking and household uses. The third source of water supply is from the sub-surface brought into use by means of shallow wells.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Free on board cars at Los Angeles. Live agents wanted in every county.

Irrigation in Southern California

By ED. J. MUNGER of Santa Paula. A Graduating Thesis at Pomona College

THE basis of the world's work is its agriculture. The strength, wealth and power of nations are not estimated in numbers of population, in armies and navies, nor in mines and mining, but in the productions of their soils. In the last analysis all human activity depends upon the food supply. The cultivated fields furnish the food supply of the world, and the rich and more productive the fields, the greater the abundance of the food supply, the more economically, extensively and successfully the manufacturer, the stock raiser, the merchant and the miner will be able to carry on his operations and thus develop the resources of the country and augment the wealth of the nation.

Knowing that the primary basis of all wealth is dependent upon the productivity of the soil, men have turned their attention to the consideration of methods and systems whereby the soil can be made to yield richer and greater returns. To this end irrigation has been employed.

Throughout Southern California industrial development during the past quarter century has been marvelous and has drawn constantly and ever unceasingly upon the food supply of the soil till at present the demand is greater than the supply. As the supply is directly dependent upon the area of land under cultivation, and the abundance of moisture; land heretofore remaining uncultivated has been tilled, and the uncertainty of the amount of the annual fall of rain has been remedied to a high degree by irrigation.

Throughout much of the area of California irrigation is practically indispensable to fruit growing and the production of crops. In many localities irrigation is the essential factor in the growing of fruits of the highest quality and the greatest market value. And furthermore in many and large areas in our Golden State, irrigation is a certainty against occasional complete losses of crops and injury to trees during the dry season. Today, in all but a few of the most humid regions in California, growers of both citrus and deciduous fruits have come to look upon the water supply and feasibility of irrigation as an element of the greatest value, and an ultimate assurance of safety in their agricultural enterprises. For this reason mighty rivers have been dammed up in their courses, gigantic reservoirs holding billions of gallons have been constructed, powerful pumping plants have been installed, a network of canals and aqueducts carry water to vast areas of land which a few years ago afforded scarcely food enough for the jack rabbit and rattlesnake, but today are made to blossom as the rose. Consequently the art of irrigation has made rapid strides in its development, and the time has now arrived when fruit growers everywhere, in order to succeed well, must understand a few of the elementary principles of irrigation.

Best at Home.

We Americans are proud of the fact that we do not need to seek in foreign countries for the best irrigation methods. The early history of western irrigation reveals the fact tnat men examined methods and systems employed throughout the entire Mediterranean region and in Africa but found there nothing that American ingenuity and genius could not improve and have improved. Thus we are able to place upon our irrigation systems the mark "made in America." Irrigation commissions from many governments have personally examined our American methods and commended them for their superiority, capacity and high efficiency.

Early History.

As early as 1769, one hundred and thirty-nine years ago, the efficiency of irrigation in relation to crop production was known to the west. The Spanish missionaries who came into California from Mexico were the first to plant fruit gardens and vineyards with facilities for irrigation. They laid out their plantations after the old Spanish style and proceeded upon the assumption that fruits could not be grown in this state without some irrigation. They ran permanent ditches through their orchards and vineyards and allowed the land to lie uncultivated after irrigation. This method though now considered very crude was the earliest demonstration of the fact that irrigation is one of the greatest essentials to fruit growing in a country with long, dry and rainless summers.

A Reaction.

With the discovery of gold, Americans hastened to California in great numbers, and it was not long before they discovered that the cultivation of the soil prevented the evaporation of its moisture to such an extent, that fruit trees and crops were able to make good growths and bear heavily with the moisture received only during the winter months. Now this was a great surprise to men and a reaction from the old Spanish conception immediately resulted. Some claimed that irrigation was unnecessary and that a thorough cultivation during the summer months would produce better fruits than if water was applied. Thus the contest between the supporters of irrigation and non-irrigation arose. But experiment and scientific procedure soon changed the attitude of the advocates of non-irrigation. Experiment proved again and again that in many soils and localities the non-irrigation policy failed to secure satisfactory crop returns and that the irrigation practice succeeded in doing it. It has required nearly a quarter of a century of experiment and tests to arrive at the conclusion that an ample moisture supply available throughout the entire growing season is required if the best results are to be secured.

A Contrast.

Universal observation has proven again and again that trees and vines planted during the wet season would make an excellent growth in the spring and continue to grow well during the early summer months, but in all cases would suffer greatly and sometimes actually die as the dry season advanced. As the soil became drier and drier during the summer months the hair and absorption roots would die, and the continued evaporation from the leaf surface would take every particle of moisture from the tree, and existence would soon be rendered impossible. In localities where the soil was heavy it consolidated like rock, and in other places where it was of a light and loose nature it would become like ashes and sand. In both cases the soil became anything but capable of maintaining plant growth. In contrast, places but a short distance away whose soil had been cultivated and mellowed after the late rains had consolidated the surface, plant life grew luxuriantly, and fruits grew to astonishing sizes, and the trees grew vigorously and were thrifty throughout the summer months of no rain and dry air. The suggestion of such a contrast was speedily employed and now irrigation and cultivation go hand in hand and make the cultivation of dry and semi-arid lands as productive as any other soils.

Three Conditions.

The connection between irrigation and cultivation is indeed intimate and has afforded much study and consideration. There are three conditions under which sufficient cultivation may reduce and possibly almost eliminate the necessity of irrigation. These are, first, providing there is an adequate rainfall at any season to supply a year's growth of crops and fruits, second, that the soil is of such a composition as to be able to hold the moisture and prevent rapid evaporation or leaching, and third, that there is sufficient depth of soil constituting a reservoir of ample capacity. The pursuit of agriculture with the absence of these conditions is fruitless unless accompanied by irrigation.

Requirements.

A study of the growth of trees, both citrus and deciduous, reveals the fact that there are many and wide differences in the moisture requirements not only in different kinds of trees but in early and late varieties of the same kinds. Citrus trees require by far the largest amount of moisture. But again it has been found that all evergreen and citrus trees do not require more water than all deciduous trees, for example the olive will bear as well with less water than the peach. The needs of all trees are largely conditioned by their age and work. A water supply adequate to cause young trees to grow well would perhaps be very insufficient for the same trees to produce fruit regularly and profitably. Trees whose roots run along the same surface, even though highly cultivated, may wilt down and gradually die, while those near by on the same soil, whose roots penetrate more deeply, flourish and do well.

Thus we see that the necessity and desirability of irrigation is variable and dependent upon the requirements of the growth of the tree or plant as well as the character of the land in which the growth is taking place. Irrigation to be pursued successfully must be pursued scientifically and only facts based upon extensive observations are of value in irrigation as in other sciences.

* * *

Possibly Detrimental.

Before passing it will be well to consider a few of the injuries that may be and have been caused by irrigation. It is equally well that we should know something of the other side of the question if there is another side to be known. Careful investigation reveals the fact that carelessness and lack of knowledge of the principles of irrigation cause great injury. Injuries due to irrigation fall under six general classes.

First—Injuries due to the grower.

Second—Injuries due to the water.

Third—Injuries due to the lack of proper drainage.

Fourth—Injuries due to the lack of cultivation.

Fifth—Injuries due to temperature during irrigation.

Sixth—Injuries due to fruit too near the time of ripening.

The grower by the careless use of water may do great damage to trees and vines. The things to know in every case are the proper time to irrigate and the amount of water to use. Experience has yet to prove that trees or vines will be injured where water is used with care and intelligence.

With the Citrus Growers

CONVENTION OF EXCHANGE OFFICIALS.

SELLING agents and officials of the California Fruit Growers' Exchange will meet at Kansas City September 29-30 and October 1 and discuss matters of interest to the citrus industry.

Eastern agents have usually made trips to the Coast and inspected orchards and packing house methods and thus become acquainted with the western end of the industry, but this year orange growers and officials will go East.

There will be at this meeting all the representatives of the Exchange, such as the eastern agents or salesmen, including a representative from all of the California exchanges, associations and special contract shippers. A great many eastern brokers and dealers will also be present. The object of the meeting will be for the purpose of bringing shipper and agent together to learn the needs of the trade.

A partial program of the convention is outlined as follows:

Chairman—F. Q. Story.

Secretary—J. L. Merrill.

Assistant Secretary—F. W. Wood.

Claims—A. D. Frazer.

Correspondence and Records—J. L. Merrill.

Economy in Telegraphing and Telephoning—T. H. Powell

Discounts and Allowances—J. P. Scanlon.

Does it Pay to Extend Courtesies to the Trade—J. S. Edwards.

It is felt that each representative present will receive much good from this meeting as it will bring them close together and that each and every one will learn in the three days time, what it would take years to learn through correspondence.

The holding of such a convention will be in line with what is being done by many large concerns throughout the country, though as now considered by the board of directors of the California Fruit Growers Exchange, only one convention is to be held, while many other commercial organizations hold such conventions every year.

The question of place of holding the convention has been considered a debatable one by some of the board members, there being a sentiment in favor of California. This, however, was deemed impracticable as business would likely suffer if all of the principals in the different markets were to be away for three weeks, as would be necessary to make the California trip.

CALIFORNIA LEMONS vs SICILY.

In its lemon stories from week to week the News has told how the trade could not understand the present low prices of Sicily lemons, when, according to all conditions of weather and supply, prices should be high. Various causes have been given, from the financial depression to the large crop in California, either of which has its effect. In this connection, there is no question but what the California fruit is fast supplanting the Sicily in the interior trade, and this also has its bearings on the slack demand for Sicily fruit and consequent low prices compared with former years. A couple of years ago the News sent letters to dealers in various sections asking them if they were handling as many foreign lemons as in past years, and if not, why not. Numerous replies were received and nearly all stated that the quantities of foreign lemons they were handling were small in comparison to what they had in former years. They gave the main reason that the California lemons were more honestly packed and could be depended on to be the same size from top to bottom of the boxes, which could not be said of the foreign fruit. For this reason their orders for foreign lemons were decreasing and their trade preferred the California fruit. Monday the Journal of Commerce printed the following on the subject, under the heading, "California vs. Sicily:"

"Is California slowly but surely driving foreign lemons out of the American market? This might appear at first glance an absurd question in view of the fact that Sicily lemons are steadily pouring into this market and being absorbed as fast as imported, but when the prices are considered and the fact is reviewed that lemon importers are known to be frequent losers in their transactions, it appears worth studying."—Chicago Produce News.

EAT CALIFORNIA SUNSHINE.

To encourage a more general use of California products throughout the world, and as a part of the broad campaign which the California Promotion Committee has instituted along these lines, the committee will address a letter to the handlers of California fruit, the packers, driers, canners, exchanges, etc., suggesting that there be included in every package of fruit that is shipped to market an attractive lithographed display card to be placed in the show windows of the dealers. The suggestion is that the lithographs be unique and catchy and say something not only about the fruit itself but about the places where the fruit is grown. In this way not only the product but the entire state will be advertised, and it will be but natural for the consumer to long for an opportunity to see with his own eyes the land that is the home of the Lucullan products of which he has become so fond for which he will accept no substitute.

It is reported that one dealer in the East increased his fruit sales five hundred per cent by some judicious displays, and away from Bristol, England, Consul J. Perry Worden has written that a catchy phrase placarded in connection with California seedless oranges, which were labeled "The Aristocrat of the Orange World," nearly doubled the sale of California oranges in that city. It has been suggested that the following advice would, properly presented, bring desired results: "You may not be able to live in California but you can get some of its sunshine into your blood by eating one of its luscious oranges."

Handsome, framed photographs of California scenes will be used in the campaign and will be instrumental to supplement and enhance the value of the placards. According to the Committee, the field for this work is a wide one, especially for the reason that so many products are distinctly and exclusively Californian, and, in all advertising the unique features will lend force to the displays.

SAMSON WIND MILLS
Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.

This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

The Torrens Land Title System

The following communication is handed the Cultivator by Mr. Edgar Leavitt of Glendale, and it has much information regarding a system which was orlginally intended to be of great benefit to land holders, but the real benefits of which were killed by the lobby which succeeded in getting riders fastened on the original bill until it has been made so cumbersome and expensive that it is of no practical value. We are glad to give place for it and hope it will cause a discussion which may lead to a more practical form of this law.

Present Charges Too High.

It has long been felt by those who had to make land transfers that the charges one has to bear, to give or acquire assurance of a sound title in this state, were needlessly expensive and too grievous to be borne. Therefore the California legislature was induced some years ago (Stats. 1897, 138, Ch. CX) to give us the "Torrens Land System," from Australia, where, as well as in Canada, it has been for many years in successful operation. Yet very few people in California have availed themselves of its provisions, and comparatively few, probably, even know of its existence.

The reason is twofold: 1st, because of those who may have known there is such a law, few cared to be the first to try an experiment with a new law which had not been tested by a supreme court decision, and which bankers and other persons of standing more or less directly or indirectly interested in the abstract companies naturally would not approve.

Second, because in the above interests it would seem as if the law has been purposely made so complicated and so expensive in its procedure as to be almost prohibitive.

Since the San Francisco fire, however, I understand that certain landowners in that city have brought their lands under the new system; not, however, until they had been compelled to mandamus a superior judge to make him do what the law requires him to do; but obtaining thereby a decision from our supreme court upholding the constitutionality of the law, establishing the Torrens System in every particular (1765 Cal. 40.)

So the first obstacle has been removed. The second, however, still remains.

How It is Done.

To bring land under "the Torrens System" it is necessary (1st) to begin a regular suit in the superior court, same as any other suit; and, second, to present with your petition, not merely a certificate of title from some abstract company, however good, but a full abtsract of title from a responsible company, which will cost a good many times as much as a certificate. Of course in this suit it is necessary (3d) to employ an attorney who must have his fee commensurate with the value of the property concerned and with the work to be done. Fourth, the court may itself decide, or in its discretion, appoint a referee to examine your abstract, no matter how responsible the company may be that made it. This examiner must be an attorney and you must pay him a fee for his opinion; and unless he reports favorably, or the court decides favorably, regarding your abstract, on its own motion your suit will be dismissed without even coming to a hearing. But if you get through all right so far, the court will then order a hearing, after which, if no evidence has successfully impeached your claim, you will get a decree containing a statement of the condition of your title and a diagram of the property, and if this decree is not appealed from within the regular time, it becomes final and conclusive against the world.

You then get a certified copy of the decree and file it with the registrar (county recorder) who issues a certificate in duplicate showing the condition of your title. If you lose your certificate you have to get an order from the court for the registrar (recorder) to give you another one—so don't lose it. When you sell your land you get the registrar (recorder) to issue to the buyer a certificate showing the state of the title in him. The registrar notes upon the record which he keeps in a special book every transaction affecting in any way the title to the land; so it is always down to date.

Insures Title.

Land once registered under the "Torrens System" can never be lost (as now in five years) through adverse possession. Present forms of deeds, mortgages, etc., may still be used, but this simpler way of transfer, mortgage, etc., is just as valid. You merely write on the back of your certificate "I, John Smith, grant (mortgage, lease, etc.) to William Jones, the real property described in this certificate. Witness my hand this—day of—19—. John Smith." Then acknowledged the same as a deed.

The fees of the registrar are very reasonable. Issuing certificate of title and one duplicate, $1.50; each additional duplicate, 50 cents; registering transfer, including issuing and registering new certificate, $1.50; memorial of filing lien, etc., $1.00; canceling a memorial or a change, 25 cents; certificate showing condition of the register, $1.50.

Simple Transfers.

It will be seen at once how immensely simplified the keeping track of the title becomes under the "Torrens System," and how inexpensive the giving assurance of a good title, as compared with the present system. It would seem that land once brought under the" Torrens System" should have a greater selling value because of great saving effected on its transfers, not only in the near future, but for all time to come. Yet, perhaps, each holder may think it is of no account to him whether a transfer is expensive or not when the land has once passed out of his hands.

Make It Practical

It would seem that the law ought to be improved so as to make the bringing of land under its provisions less complicated and less expensive, at least by letting a certificate from a responsible abstract company suffice instead of requiring a full abstract, and then holding the abstract company responsible without requiring a re-examination, except in disputed cases. But even as the law is, those whose claim of title from the United States patent is not too long so as to make the required abstract of title too expensive, may well consider whether it is not worth while to be at the necessary trouble and expense to bring their lands under the provisions of the "Torrens System."

And it must be that the time will come when land owners and lot owners will begin to ask our candidates to the legislature why, if we must have abstract offices, they should not be owned and operated by and for the benefit of the county the same as other county offices that meet a public necessity?—Edgar Leavitt, Glendale, Cal.

Deciduous Fruit Culture

SUGGESTS METHOD OF FIGHTING THRIPS.

Prof. E. H. Twight of Berkeley has written the following regarding a possible method of handling the ever troublesome thrips:

The enormous damage caused by the thrips to the orchards of the Bay counties and probably to many other districts of the state during the last few years has attracted the attention of all those interested in the fruit industry, and as a result the United States Department of Agriculture, the State Agricultural Experiment Station and the various county entomologists have been in the field trying to cope with the pest. It seems, however, so far that little success has been met in checking the increasing damage of the thrips.

Dudley Moulton, the expert in charge of the United States Department of Agriculture work in Santa Clara Valley, in Bulletin 68 of the Bureau of Entomology, explains that several of the contact sprays can kill the thrips but that these insecticides have not been successfully applied, as they cannot be used without injury to the tender buds and blossoms. A few days after an apparent successful spraying on a given area the thrips appear to be as plentiful as before the spraying was done. The same objections are made also against the spraying against the larvae.

The writer has suggested, however, that the best time to reach the thrips would be while they are in the ground during the second larval stage. The larvae or the pupae seem to be in the ground from early summer until following spring, and there ought to be little trouble in destroying them in the ground during that stage.

When phylloxera first started its destructive work in France the government and railroads took up the fight and it was soon found that under favorable conditions the phylloxera could be killed in the ground by the proper use of carbon bisulphide or of potassium sulfocarbonate. Some very careful investigations were made at the time (1872) and absolutely reliable reports on the proper methods of application, quantities to be used according to soil conditions, are at hand, which ought to be very valuable in fighting the thrips.

In the case of the phylloxera, the bisulfide treatment was not altogether a success because the insect can often be found several feet below ground under the old bark or crevices of the roots, where it is extremely hard to reach; the bisulfide has also to be injected fairly deep to do the work. In the case of the thrips, however, we are told in the bulletin above referred to that the larvae "goes down three to ten inches, the usual depth being about four inches." It seems that there ought to be no trouble to reach them under these circumstances.

The object of these remarks is to give some information regarding the methods of application and amounts used in the treatment of soils against phylloxera; these amounts have been found safe when applied during the dormant season. As the treatment against the thrips would be superficial these amounts could probably be reduced.

The best time for the application of bisulfide would be a few days after the first rain in the fall. If the soil is too dry, the fumes escape too readily; if the soil is too wet, the fumes do not diffuse properly and are apt to accumulate in pockets and kill some roots.

A loam is the best soil to work with, as the diffusion of the gas can take place easier and more regularly. A compact soil is very hard to treat, as the gases will not travel through it. A gravelly soil must be handled with care, so as to insure an even distribution of the insecticide.

The soil must not be cultivated before treatment, as packed surface is needed to prevent the escape of the gas.

The application could be practically and quickly made by using an "injecting plow." This consists in a subsoiler that can be regulated to the proper depth. Back of the coulter is a pipe through which the bisulfide is injected by means of a measuring force pump. A small reservoir on the frame contains the bisulfide to be used. In the work against the thrips there would be no need of a subsoiler. A cultivator with teeth three feet apart, to cover the space between two rows of trees would be sufficient, since the bisulfide would be applied about six inches below the surface. The teeth of this cultivator would have to be made more like those of a subsoiler, so as to disturb the ground as little as possible, and the instrument would have to be followed by a roller.

In the phylloxera treatments between 150 and 300 pounds to the acre have been used by the writer, according to the instructions of the French government. However, it is probable that 100 to 150 pounds per acre would be sufficient against the thrips.

The sulfocarbonate of potassium used for some years extensively was found too expensive, and meant the transportation of large amounts of water to put this salt into solution. It would probably be too expensive to be used in California.

As carbon of bisulfide is manufactured in large quantities in California and can be bought at reasonable figures, it is hoped that its use may be found practical in checking the ravages of the thrips. There is no mechanical difficulty in manufacturing the proper apparatus for the application of this treatment, if it is found effective.

DESIRABLE VARIETIES OF EASTERN GRAPES.

There is a good demand for a limited quantity of Eastern grapes of the Concord type, and with proper care they may be raised in nearly all parts of California. They have not proved a success in the Imperial Valley on account of the hot sun. One of the finest grape arbors we ever saw is growing at the Otis ranch at Pomona. The entire area of the arbor, about 12x29 feet, was excavated to a depth of three or four feet; a load of beef heads secured at the slaughter house was dumped in, a little soil on top of this then a wagonload of manure and then filled to the top with good soil. This seemed to be a great deal of labor for a half-dozen grape vines, but three Niagara and three Concord cuttings planted around the border produced between 600 and 700 pounds of fruit the second season. The grapes were of extra fine size and flavor, giving off an aroma that permeated the atmosphere for some distance.

Agawam and Lindley are excellent varieties of the Eastern type of grapes. The former has a pink color like the Catawba, but is a finer grape, an abundant bearer, and has good flavor. Grown on a trellis, there seems to be no limit to its bearing capacity. It is a medium early variety and in favorable localities should prove a profitable variety.

Crimson Winter Rhubarb and **Berry Plants**

Our Specialty

1000 choice Navel Oranges, together with a few other Citrus Trees. April and May are best months to plant Rhubarb for heavy Crops next winter. It has never been equalled as a money maker. $1.50 per dozen, $6 per 100, $40 per 1000. Pedigreed plants.

CALL A HALT.

The Watsonville Pajaronian again desires to ask the apple growers, packers and shippers of what avail even lower freight rates on apples to eastern points will be unless the shipping from here of green and undersized fruit at this early period for Bellefleurs and Newton Pippins is stopped. Quality, size and pack should be the slogan of every person connected with the apple business in this valley, and it is up to the growers and packers to make it so. Now is the time to act in the matter. There should not be one minute lost. Green, undersized fruit is being shipped out from here daily and will continue for several weeks unless checked. The marketing of such fruit is bound to have a bad effect and as a result every grower and packer will suffer therefrom in the long run.

The Pajaro Valley Packers' Association, recently organized, includes in its membership almost all the brokers and packers, and we believe that that association should at once take up this matter and see that a stop is put to this decidedly wrongful method of the too early marketing of green and undersized apples.

The apple industy is the leader of leaders in the Parjaro valley. It is at present the big mainstay of the success and prosperity, either directly or indirectly, of almost every other business enterprise in our midst. The present year the apple crop is a large one and the quality of the fruit promises to be better than for several years past. We are all interested in seeing good returns derived for this year's crop and nothing done that will have a tendency to take away from the Pajaro valley its reputation of being the best and most productive apple district in the world, and a correct solution of the matter right at present lies within the power of the packers and shippers.—Pajaronian.

HANDLING THE APPLE CROP.

J. H. Hale, South Glasstonbury, Ct., gave a very able address upon the subject of "Handling the Apple Orchard." Mr. Hale said the apple was the standard of all fruit. The early planting of apples was for drink and not for food, but today the apple is grown principally for its food value. The American people are fast coming to appreciate its value for food, and today fifty times more fruit is being consumed than in former years. The market today is demanding the highest quality of fruit, and is willing to pay a premiuum for choice goods. Size, uniformity and color are three essential requisites in high quality of fruit. Mr. Hale does not think that the old orchards found upon the farms today can from any method of pruning or tillage be made to produce a high quality of fruit. The tree must be trained for its special purpose in order to get best results. "I think," said Mr. Hale, "a far larger portion of old orchards could be made to produce far better fruit were they given proper care and cultivation. Low trees are very desirable; with them expense is reduced and cultivation can be better conducted. In seclecting a site for a fruit orchard, select rolling land and not low, cold soil. Tillage should ever be the watchword of the orchardist.

Escondido made great preparations for its grape day on September 9, having special excursion rates from all sections, and taking all visitors to the vineyards where they were permitted to have their fill of grapes.

"LEST WE FORGET."

In a recent number of the Rural Californian appears an article headed "Lest We Forget," the apparent purpose being to attack the character of a dead man, B. M. Lelong, secretary of the old State Board of Horticulture.

"His administration," the article states, "in the years of 1890 and '91, up to the time of its abolishment, was open to severe criticism, not only by a large number of growers, but also from outside sources." The article further states, "It is a matter of horticultural note that the old Horticultural Commission, under the Lelong regime, was tinctured with politics. Indeed the secretary and chief officer was a charlatan in scientific investigation and a buccaneer in the realm of horticultural literature. It is no exaggeration to state that the Board's publications at that time were the laughing stock of intelligent fruit growers and of studious minds the world over."

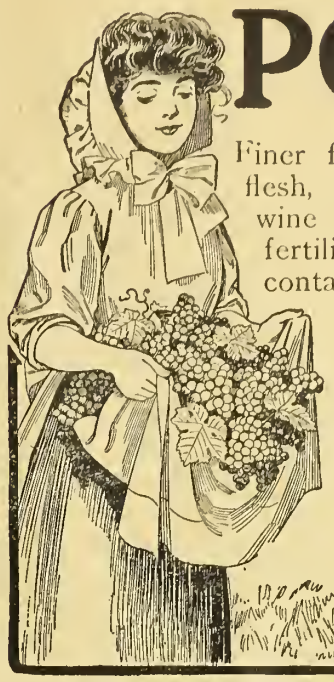
Such an unjust attack, especially upon the character of a dead man, seldom comes under the observation of the public; for what purpose such an attack was written is inconceivable. If it was the design of the author to wound the feelings of friends of Lelong there can be no question of his success; if to gain some good, his failure is complete. The shafts of malice cannot affect Lelong but who can tell how deeply they may not penetrate the hearts of his friends, or how painfully they may not lacerate the heart of his widow and that of his son.

Probably it is true at the time that the old State Board of Horticulture was in existence politics figured to a greater or less extent. It is also probably true that a political machine, as it is commonly called, figures more or less today. If it was the purpose of the writer to attack by indirect methods the political influence so prominent in state and county affairs it was unnecessary to use a corpse as a shield. There are plenty of live lions to attack and the errors of the present are much more necessary to correct that to delve in the graveyard of the past.—S. A. Connor, Los Angeles.

CHERRY HISTORY

It is still asserted in school books that cherries were introduced to this country by the "fruiterer" or green grocer of Henry VIII; also that they were not common for a hundred years after that time. This is an error. Mr. Thomas Wright found the name in every one of the Anglo-Saxon vocabularies which he edited. So common were they, and so highly esteemed, that the time for gathering them became a recognized festival —"Cherry fair" or "feast." And this grew into a proverbial expression for fleeting joys. Gower says the friars taught that "life is but a cherry-fayre," and Hope "endureth but a throwe, right as it were a cherry-feste." There is more than one record of the purchase of trees for the king's garden at Westminster, centuries before Henry VIII. was born. But Pliny contradicted the fable, as if in prophetic mood. After telling that Lucullus first brought cherries to Rome, (from Pontus in 680 A. U. C.) he adds that in the course of a hundred and twenty years they have spread widely, "even passing over sea to Britian." —"Cornhill Magazine."

Visalia prunes will be about one third of a crop.



POTASH

Finer flavor, better color, and firmer flesh, whether for shipping or for the wine press, is secured for the grapes fertilized with a commercial fertilizer containing not less than 10% of Potash.

Grapes

will quickly exhaust even the richest soil—a vineyard situation exactly met by Potash.

Colusa county farmers will put in 4000 acres of flax the coming season.

Irrigation and Forestry

IRRIGATION IN CALIFORNIA.

Continued From Page 267

Among the greater dangers due to the water comes that from the use of too much water. Over irrigation causes root and gum diseases in lemon and orange trees, drowning of trees, injury to quality of the fruit, a raising of the water level too near the surface of the ground, and in many instances trees have been known to be killed outright by over irrigation.

Injuries due to lack of drainage are of the greatest importance. Water allowed to stand too long in orchards not properly drained causes the leaves to turn yellow, sometimes the death of the trees themselves, and the souring of the soil, which quickly promotes gum and root disease.

It is often the case that many of the injuries now attributed to irrigation are not caused by irrigation but the lack of cultivation after irrigation. Every irrigation should be followed by a deep and thorough cultivation or else the soil will become baked, hard and lifeless.

Great care should be exercised in summer irrigation or else much damage will result. In no case should orchards be flooded during the hot summer months, as water allowed to stand around the trees when the temperature is high will cause scalding of the roots, cracking and blistering of the bark, and sun-burning of the fruit due to reflection of the sun's rays from the water.

The greatest care should attend the use of water during the ripening of the fruits. It has been found that the flavor and quality may be damaged, and fruits made watery and subject to early decay if too much water be applied during the ripening season. Again some fruits will not ripen at all if too much water is present. This is especially true of grapes.

When?

When should water be applied? This is a question somewhat hard to answer. But in every case irrigation should be in advance of any want of water by the tree or crop. One must study the tree or crop and know about it from start to finish. A number of considerations must be made before one can safely advise as to the time of irrigation. When water should be applied depends entirely upon the nature of the soil, rainfall and climatic condition, the nature of the crop, and the ripening season.

Throughout warm and arid regions where the soil is of sufficient depth for great retentiveness and where the winter rainfall is not as copious as wished, heavy winter irrigation followed by deep and thorough summer cultivation produces excellent results. While the deciduous trees are dormant any amount of water may be safely applied on all soils except the clays.

Summer irrigation is resorted to in arid regions to keep up the early spring growth and insure the proper development and ripening of the fruit. Again, summer irrigation may be practiced effectively after the picking of the fruit to insure growth and enough to produce and fill the fruit buds for the year following.

Fall irrigation is a success in regions where the rainfall is short. In such a case there would be excessive drying of the tissues and bark of the tree. Again, it often occurs that trees becoming dormant early may produce an undesirable fall bloom. Both these dangers can be averted by irrigation.

Method.

A question that has been warmly debated by irrigators in all seriousness is the question of whether irrigation by flowing water is as good as that of falling water—rainfall. Rainfall districts arrayed themselves against irrigated districts and the war was on. Experience gained during the past decade has settled the question beyond the shade of a doubt that it makes no difference whether irrigating water fall or flow.

The development and utilization of water for irrigation has taken a very prominent place in our industrial activity and has called into the field captains of industry with their millions, and also the latest and most approved engineering skill. The development of water is one of the most important factors of the day, and the individual or corporation that successfully develops large and unlimited quantities of water have in their hands the prosperity and progress of the state.

Sources.

There are four general methods for developing water. First, the diversion from streams; second, pumping from streams and lakes; third, development from overflow; fourth, pumping from wells.

The earliest attempts at irrigation consisted in diverting a small stream from the main stream. This was done by placing a cheap and temporary obstruction in the main stream and the water thus diverted led off by a side ditch to the land at no great distance away.

In situations where large streams or lakes lie adjacent to fertile lands, but at an elevation lower than the land to be irrigated, pumping is resorted to. Current wheels, horse-power, steam and gasoline pumps are all available in the placing of such water upon the land.

The third method, the development of the overflow, is practiced in regions of semi-arid character and where the land of the country consists of rock, gravel and sand, through which large quantities of water sink very rapidly. Streams flowing through such a country can be made to yield much more water by throwing a water-tight dam across their course and thus causing the water to rise. This has been done in a large number of cases and increased irrigation facilities to a high degree. The success of the method depends entirely upon the character of the soil lying underneath the bed of the stream. It must be a good water carrying medium.

The last method and one widely used is that of sinking deep wells into water bearing strata and pumping from the same. Throughout California during the last eight years more pumping plants of this nature have been installed than during the whole history of irrigation in the state. In this way many regions that could not be irrigated in any other way were made

NEW GROWTH ON MOUNTAIN SIDES.

fertile and highly productive by waters pumped from wells. The cost of construction of plants depends upon the depth of water, distance to be pumped and the amount available. Steam, electricity and the gasoline engine all rival to furnish the motive power. At present the gasoline engine leads in cheapness of construction and cost of operation.

Canals and Pipe Lines.

We shall now consider modes of conveyance of the water from the streams and the pumping plants. From the standpoint of cheapness the open ditch stands first. But this method is wasteful of water through evaporation and seepage. Land also is wasted and rendered useless. Weeds are a constant menace along the banks of the ditch and give their seeds to the water to be spread upon the land. Loss of water can be remedied somewhat, by paving the banks with stones, but this renders the land unfit for cultivation after the irrigation season. By far the best methods of bringing the water to the land are by conveyance through round tile, cement pipe, or riveted steel pipe, sunk below the surface of the ground at a depth allowing for deep plowing. By these methods water can be carried over both even and uneven ground with the least possible trouble, and in the long run, expense.

Getting the Land Ready.

We have now acquainted ourselves with the development and bringing of the water to the land. Now the preparation of the land for its reception must occupy our attention.

After the vegetation and stones have been removed the land must be made as level as possible. A carefully leveled and smoothed field saves time in applying water, improves the crops, insures a great equality of moisture throughout, and greatly reduces the cost of harvesting. Heavy scrapers. rollers and land levelers operated by big teams are used in the leveling process. The cost runs from one dollar to fifteen dollars, varying with the topography of the region.

Systems.

There are three systems of irrigation, surface, sub and inter-irrigation. Surface irrigation applies the water either by flooding large areas, in basins around the trees, in small furrows running close together and parallel, or in larger furrows, much wider apart.

Sub-irrigation, as the term implies, applies the water below the surface through a system of underground pipes having outlets at equal distances apart. The difficulty thus far has been in preventing the pipes from breaking and becoming clogged up by the ingrowth of roots. Cement pipe has failed to furnish good results as a means of conveyance.

The third system, inter-irrigation, consists in distributing the water above ground, but allowing it to go below by means of holes some six or eight inches in diameter and from ten to thirty inches deep at distances of from eight to thirty feet apart. The holes are dug in line between the tree rows and kept filled with water during the period of irrigation by a stream running from one hole to another. The objections to this system are mainly two. First, it requires a large amount of water and the process is slow. Second, it leaves the orchard filled with deep holes and ditches, and renders cultivation difficult and somewhat dangerous.

Surface Method Best.

Methods of application of water vary with the amount of available water, the nature of the soil, topography of the field, kind of crops, etc., so that in deciding on what is the best method the attendant circumstances and conditions must be carefully studied. A few points most necessary to consider are the distribution of the water so that the land will be moistened equally throughout at the greatest possible depth, the economy of time and labor, the economy of water, prevention of waste, and the leaving of the land in the best possible condition after irrigation. The method that meets these considerations will be the one that is most desirable. Half a century of irrigation experience has proven that surface irrigation in its varied forms has produced the best results.

The first method under this system is flooding. It is the most rapid of all methods. A large body of water is allowed to spread freely and rapidly over the soil. The results are not good, for at best the ground is only partly soaked, mud holes and dry places make up much of the field after irrigation. Its only redeeming features are cheapness and speed. It is very disagreeable in that it requires the operator to work in the water, and he is obliged to use all his strength in trying to get the water over the entire surface, and this he fails to do.

The check method is a great improvement over flooding. Before the water is turned in, the field is lined up in checks, and the movement of the water confined to these checked areas; thus a more equal distribution of water is assured. By this method the irrigator knows that a given amount of water has been applied to each area, the water can be quickly spread throughout the field and easily held in control, and leaves the land surface in a better condition for cultivation. The above methods are feasible only where the fields or orchards are comparatively level.

The basin method necessitates the digging of large basins around the bodies of trees and has been used effectively in the irrigation of trees planted on hillsides too steep for other methods of irrigation. It requires only a small stream for operation. Its chief advantage is in the irrigation of small trees. It requires constant attention, and is expensive from the standpoint of labor. The objections offered are that this system is expensive, as it requires a large amount of labor to construct the basins. Second, in allowing the water to stand around the trees, root and gum diseases are caused, and in time a hardpan is developed. The land surface after irrigation is not left in a very good condition for cultivation.

A better method than any of the above is the deep furrow system. This consists of having one or more large furrows running lengthwise between the rows in the orchard. The water is turned into each furrow and allowed to work its way slowly down through the orchard. This system works well only on very level ground, where seepage is quite rapid in all directions from the large furrows. It requires a large volume of water. The land is not left in the most desirable condition for cultivation, although the cost of operation is smaller than any method yet discussed.

By far the most popular, practical and best method of irrigation in California is the small furrow system. It works equally well if managed right in most every locality. The orchard is furrowed off into small furrows about six to eight inches deep. The furrows run parallel through the orchard and are placed close together, bank to bank. Each furrow contains a little rill of water which percolates down through the furrow very slowly and proceeds with extreme slowness along the course. The water at the head is equally divided and distributed to each furrow by means of small half-inch holes bored in the containing flume. These openings are made larger and smaller by means of a small metal gate. The water thus equally divided into tiny streams, is allowed to work its way down the orchard with such slowness that a week or ten days is required for the water to reach the ends of the rows. At the end of this time the orchard is thoroughly soaked and the moisture equally distributed in a most satisfactory way. Some of the advantages of this system are that it soaks the ground completely preparation of the ground for this method is not expensive, as it can be done by teams, water is not allowed around the body of the trees and causing root and gum diseases, the distribution is automatic and requires the least attention, and leaves the land in the best possible condition for cultivation after irrigation.

Cultivation.

At the close of every irrigation the ground should be cultivated deeply both ways and the surface left in a smooth condition. The ground should be cultivated at least every two weeks during the summer irrigation period. Experience drawn from the Limoniera Ranch in Ventura county has proven that irrigated ground cannot be cultivated too much; especially is this true in lemon culture. All irrigated grounds seem to show an especial tendency to baking and the frequent and deep cultivation is the best preventive of this danger. Again the looser the ground is kept and the more frequent the cultivation the longer the moisture is retained and thus reduces the number of irrigations.

Composition.

The success in irrigation depends not only upon the amount and constancy of water, but also in the chemical composition of the water and the silts it carries in suspension. In every case the salts and silts carried that are distributed to the soil in irrigation can either greatly improve the soil or render it unfit for crops or any vegetation. In New Mexico throughout the Pecos Valley region farming has become almost unprofitable. An examination of the waters used for irrigation showed that it contained from 113 to 152 parts of common salt, sodium, potasium and magnesium sulphates per every one hundred thousand parts of water. A second and more convincing example of the relation of the chemical composition of irrigating water to the productiveness of soil comes from Riverside county. An orange grove which had been irrigated with water containing from 137 to 171 parts per 100,000 of salts consisting of three-fifths common salt one-fifth Glaubers salts and sodium carbonate, began to appear sickly and in three years died.

The second factor, the amount of silts carried by irrigation waters is of an equal importance, especially in regions of a semi-arid nature. The heavy deposits of silt are in every case a great agricultural benefit as they add to the fertility of the soil and supply two deficiencies, nitrogen and organic matter.

The effect of soluble salts upon soils is open to considerable discussion and demands much study. In every case the danger point is difficult to state and depends entirely upon the kind of crop grown, the soil, the drainage system and methods of cultivation and

FARMERS' BOOKS
Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

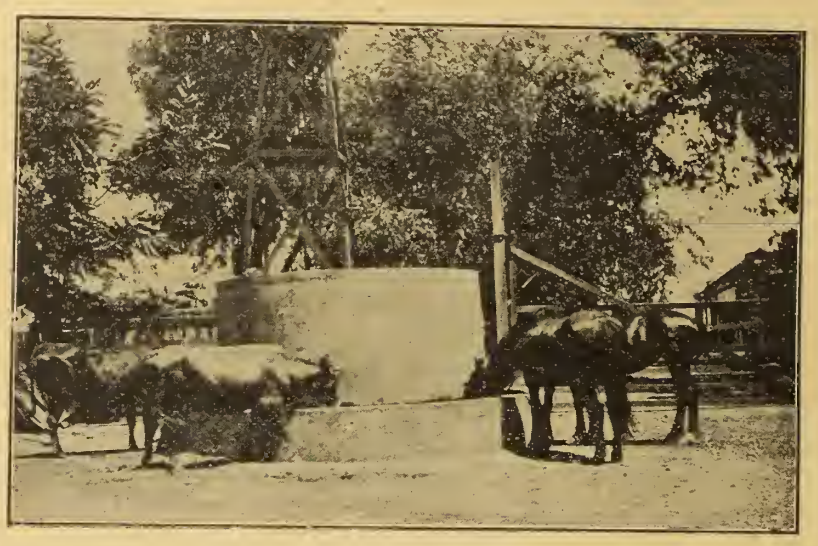
MODEL WATERING TROUGH.

WHILE traveling through Sacramento county recently, a Cultivator representative happened in on the ranch of G. W. Foulks, near Elk Grove, and in conversation with Mr. Foulks, learned of a watering trough which has so many admirable qualities that we later wrote for a photograph of the trough and tank which was a part of it. The description as furnished by our representative is as follows:

"The trough and its reservoir resemble a coffee cup in its saucer. The cup would be the reservoir and the space between cup and rim of the saucer the trough. The reservoir is 6 feet high; the trough is about 30 inches high and it is 18 inches between reservoir and the inside edge of rim and trough.

"About 30 inches in the trough is separated from the rest by two partitions, so that a floating ball can be placed in it, allowing more water to flow into the trough as the cattle



drink the water out, and keeping the trough from overflowing. Hence there is always an even amount of water kept in the trough.

"The reservoir holds just about 4000 gallons; its walls are of 8-inch thickness and 6 feet high; the inside diameter is 10 feet. The trough will permit 25 head of stock to drink from it at one time. The height of the trough and its shape and width keeps stock from getting their feet into it and thus fouling the water.

"The trough is entirely made of concrete. It took about two tons of cement. The concrete was made two parts sand to one part cement and all the crushed rock which could be worked into the mortar. First the foundation was laid for the trough and reservoir, which was 12 feet, 8 inches in diameter and 8 inches thick.

When the foundation had set the middle point of it was found and around it a temporary barrel-shaped frame was made of three-inch staves. These were bound together with galvanized wire and around this frame a second frame was made in like manner at a distance of 8 inches all around. Then the concrete was packed in after two pipes had been inserted, one to let the water from the reservoir into the flush box and the other from the reservoir to the outside of the trough, so that the reservoir could be completely emptied if a person ever wished to do so. After the wall of the reservoir had set the staves were taken down and the concrete walls wound with galvanized wire to give the wall strength and to protect it from earthquakes. Galvanized wire was used because it would not rust so easily. Each strand of wire was twisted together each time the wire was brought around so that if one strand broke the rest would hold.

"After the reservoir was made, the rim to the trough was built in like manner. The staves were 16 inches high; the inner staves were 18 inches from the wall of the reservoir and 6 inches between the staves of the two frames. The rim of the trough was bound in the same manner as the reservoir with wire, and a pipe inserted so the trough could be emptied whenever desired. I should have said that the foundation was laid with wires crossing it all over.

"After the rim to the trough was made, partitions were put in for the flush box and a small pipe inserted through one partition to let water flow into the trough. After the trough was completely finished a ball and valve were put in to govern the flow of water into the trough. The whole structure of reservoir and trough was plastered over with cement for a finish. A cover was put over the flush box which was of wood. Two-inch pipe was used throughout the trough. Valves or plugs of wood could be used upon these outlet pipes.

"The whole reservoir, completed, cost between $50 and $60.

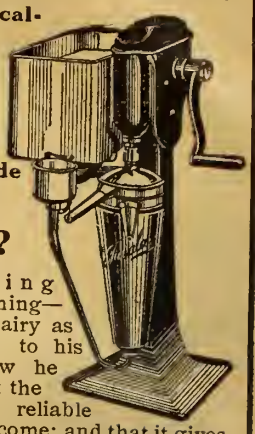
"In wrapping galvanized wire around the reservoir it would be better to drive small old bolts into the concrete, so the wire could be wound around them and the strands thus kept from slipping.

"The reservoir is kept full by a windmill near. To keep it from overflowing a pipe can be put in two or three inches from the top and brought down alongside the reservoir through trough, to let the water run away."

WRONG MILK FEVER TREATMENT.

It is reported that a man gave his cow the air treatment for milk fever, and after filling the udder with air he probably thought he would improve upon the directions given him by tying the teats tightly to keep the air from escaping. The cow died promptly and the man denounced the air treatment for milk fever as a fake or fraud. This is an example of the proneness of man to want to do things differently from anybody else; examples of which are very common among farmers, and shown in methods of tilling the soil as well as treating disease. The methods of the most successful farmer in a neighborhood are rarely imitated by all of his neighbors. In the case of the cow, the air vitiated by the diseased condition it encountered should have been allowed to escape.—From Stock and Home.

THERE is a MAN
in your locality who is making $2.00 against every one that he made last year.



HOW?
By doing mixed farming—running a dairy as an adjunct to his farm. Now he realizes that the dairy is a reliable source of income; and that it gives regular employment to all the members of the farm.
But, let us not forget to say, that upon the advice of the Dairy Station, he investigated **all** the standard makes of separators—and proved to his own **satisfaction** that the
Tubular Separator
is 50 per cent better in every way than all other makes, and that it is a profit maker—a result giver.

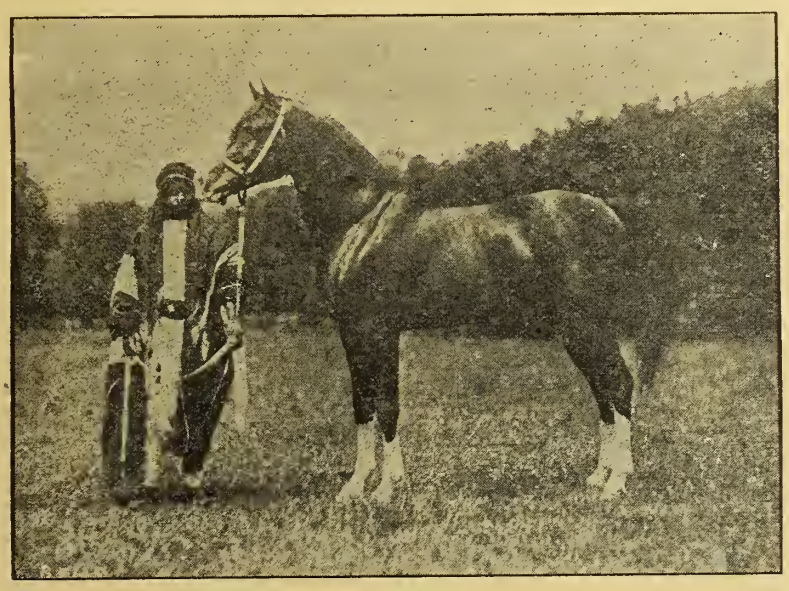
The Arabian Horse in California

MUCH interest has been aroused in this State by the recent purchase, by a Californian, of a string of ten Arabian horses. The purchaser is Miss Eleanor Gates, the author, known in private life as the wife of Richard Walton Tully, the playwright.

The horses in question are the first pure Arabs that have ever come into the State. From time to time there have been stories concerning horses of alleged Arab blood, and doubtless there are many horses in the State that have a strong Arab strain. This is particularly true of the mustang horses of California which are descended from horses of eastern blood turned loose on North American soil by Cortez. But El Rancho de las Rosas string is the first shipment of absolutely known blood.



It consists of four stallions, one twenty-nine years of age, one twelve, one seven and one three years old. Their owner has brought four colts of the old stallion, the youngest colt being five weeks old. Of the mares, Miss Gates has one which is of the rarest blood of the Desert. It was bred by Lady Anne Blunt of England and has a pedigree which goes back to the days of Abraham's great grandson. This mare is of the family Seglawich Jedranich, of the strain of Ibn ed Derri. One of the stallions, Mahruss, is of the same rare family and strain. He has just reached his full growth, being now seven years of age, and is the only grown stallion of that rare family outside of Asia.

The Arabs have been on exhibition at Sacramento during the recent State Fair and have enlisted much attention. To those unfamiliar with the history of the Arab, they were a great surprise, and to some extent, an education along horse lines.

Miss Gates says that a great many people seem to think that the Arab horse is either spotted or coal black; this is owing to the fact that circuses often own and show black and spotted horses as Arabians, but every traveler and Arab student who has been into the desert agrees on two points concerning the Arab horse; one, that the Arab is never spotted and is rarely black, there being, perhaps, one or two black horses in a herd of a thousand; secondly, that the Arab horse is never higher than fifteen hands one inch, and that the average Arabian horse is fourteen hands one inch in height. This is considered by the Bedouins the ideal height for his horse.

The Arab horse, it would seem, is an entirely different animal from the horses of cold blood, for he is entirely different structurally, having three less bones in his body, a wind-pipe double in size, a dished face and a vertical arrangement of his organs as compared with the horizontal arrangement of the ordinary horse. He is also built high in the quarters which gives him great motive power and the high carriage of his head and tail distinguishes him.

It is Miss Gates's purpose to raise full-bloods which will be sold to governments, and part-bloods for carriage, saddle, polo and cavalry use. The horses are to be taken to the Tully country home at Alma, Santa Clara County, California.

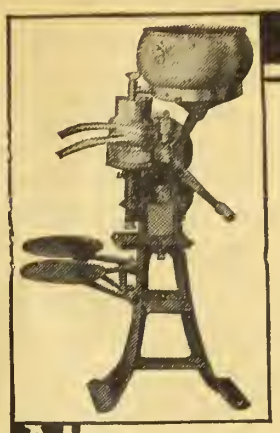
Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

DEHORNING CATTLE.

"Gentle" bulls are the most dangerous of all because you trust them so they catch you unawares. One of the best safeguards against the crazy bull is to take his horns off close to his head if he comes to you with them on. I have rarely spent a night at a breeder's farm that there was not an exciting story to tell of some one's narrow escape or death from a vicious bull.

A few years ago men were fined for dehorning cattle, but as time passes the class of fanatics who oppose this simple safeguard grows less until now you rarely see a bunch of steers that the large majority of them are not dehorned. So far as I can see the process of sawing horns off is painless, if done with reasonable intelligence, for the horn was made to fight with and not at all sensitive. But on breeding farms where calves are raised why not take the matter in hand at the proper time when the calf is two weeks old and the horn button is just making its appearance. Get you a stick of lunar caustic or caustic potash, as it is sometimes called, for 5 cents. Be careful in using it, not to get any of it on your fingers or about the face. Proceed carefully by first tying the calf firmly to a fence post. Then with a pair of scissors clip the hair from around the button until you can plainly see and feel the tip of the button. Now with a cup of water dip the end of the finger in and wet the button and no more of the head or you will make a botched job of it, resulting in a large sore. With dry fingers prepare the caustic by wrapping a rag around one end of it to hold the pencil by, then dip the pencil in the water and carefuly rub the button until the flesh looks red; then stop and leave the calf tied until she is dry, to keep other calves from licking it. The only danger to the calf is in your overdoing it by getting too much water on the calf's head and letting the dissolved caustic run down the calf's head. If you put too little on you can put on more another time, so it is best to err on the safe side. In most cases you had better get your wife to read the instructions and perform the operation.—Home and Farm.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.



TIME TO BUY CREAM SEPARATORS NOW

There never was a better time to buy the best of Cream Separators than right now.

The advantages derived from the use of the good Cream Separator are greater in the fall and winter than at any other time,—when the cows are old in lactation, the loss of butter-fat is otherwise greatest, and butter prices are highest.

Likewise are the advantages of the superior DE LAVAL separators greatest over imitating separators when the milk is hard to separate and the weather cold and variable.

In every case a DE LAVAL separator, of suitable size, will surely at least save its cost between now and July 1st next, and go on returning 100 per cent per year on the investment for twenty years to come.

The agricultural and particularly the dairying outlook was never brighter and more promising.

WHY NOT BUY NOW?

To protect animals from the annoyance of flies the following preparation is recommended: Two-thirds linseed oil, one-third crude carbolic acid. Apply with a swab to the tips of the hair, especially about the horns, and the animal will not be bothered with flies of any kind for a week. This preparation, it is asserted, is excellent for horses, answering the same purpose. The linseed oil prevents the hair from coming out, and also retains the carbolic acid. Another remedy is to take two or three small handfuls of walnut leaves or pennyroyal on which pour two or three quarts of cold water. Let it infuse over night, pour the whole next morning into a kettle and boil for fifteen minutes. When cold, it is fit for use. Moisten a sponge with it, and before the horse goes out of the stable let those parts which are most irritable be smeared with the liquid.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market, Citrus Markets, 286, 287.

FARM MANAGEMENT.

We recently made a note regarding aid which the Department of Agriculture is willing to give to farmers who may be excellent farmers in the sense of producing crops but have not that business capacity to dispose of the products of the farm advantageously, or possibly there is something wrong as to power of the land to produce satisfactory crops. Regarding this work and its scope, we wrote to W. J. Spillman, in charge of Farm Management Investigations, which is under the Bureau of Plant Industry, and have received from him the following statement:

"I will say that the Office of Farm Management has now been in operation for four years. The fundamental idea underlying its work is that of carrying the results of scientific investigation to the farm and helping the farmer to put them into practice. We have not yet grown sufficiently to cover the whole country with our work. Our plan of development has been to divide the country into districts of two or three states each, and put the best man we could find in each of these districts. It is the duty of this man to make a careful study of the types of farming prevailing and the adaptability of these types to local conditions; to make a careful study of the practice and methods of successful farmers wherever they can be found; to ascertain what the pressing problems of the farmer are. If these problems are such as can be solved by the application of knowledge already in hand, we then undertake to put this knowledge into the hands of the farmers. Frequently, however, we find that the problems are such as require extended scientific research. In this case we call the attention of scientific investigators to the problems.

"As I said to Mr. Neff, we hope that the first of next July we can put a good man into California to take up this kind of work. I understand that one of the pressing problems of your state at the present time is the development of satisfactory systems of farming on the wheat fields that have been cropped so long without any attention to their fertility that farming on them is becoming precarious. This, of course, is one of the large problems which one perceives merely by passing through the State of California. I have no doubt that when our man is on the ground he will find many others that are not so apparent.

"We appreciate your offer to co-operate with us in this work, and I assure you that we shall be pleased to make the fullest use of such co-operation. When we are able to put a man in the state we shall instruct him to get in touch with you with a view to getting and giving information whenever it is possible."

SPARE THE TREE.

One of the greatest heritages of California is the magnificent big basin park in Santa Cruz county. This park is the property of the State of California and under the direct supervision of State Forester Lull. Last year much criticism was received by Mr. Lull for his contracting with the lumbermen to remove some of the trees. These trees were claimed by him and by others to be practically "dead timber." This the State Forester is permitted to have removed and he claims that he did so last year with the feeling that he was preserving the best interests of the State.

It is now reported that other contracts are about to be entered into by which more of the "dead timber" is to be removed from the park. This the watch dog of the park, the Sempervirens Club of San Jose, will endeavor to prevent. Regarding this work around the park the San Jose Times says:

"The park in question is one of California's grandest sights and always evokes the admiration of all who have occasion to visit it and view the towering sentinels that have stood, practically undisturbed, for hundreds of years. The movement to preserve these trees in accordance with the interest of an act of the State Legislature, which appropriated money to buy the park for all the people, deserves every encouragement on the part of every citizen.

"Year after year great inroads have been made on California's once magnificent forests, and they have almost been relegated to the things that were. Thoughtful minds have come to rescue of the State and are striving hard to save a few of the great redwood trees that have for years been the marvel of tourists from every land. Preserve the trees that they may prove a source of pleasure and interest for the present generation and carry a worthy object lesson to generations yet unborn."

STATE CAPITOL REMOVAL.

A constitutional amendment will be submitted to the voters of this State at the next election, providing for the removal of the State Capitol from Sacramento to Berkeley. The claims of either Sacramento or Berkeley cut no figure with the great mass of the taxpayers of the State. The sole question is wherein will the greatest interests of the taxpayers be conserved? From that standpoint we cannot see good reasons for making the transfer from its present location and believe every voter in the State should vote against the amendment. In the first place there is no particular objection to Sacramento as the site of the State Capitol. It is near the center of the State and it is not necessary that the State Capitol should be located at an ideal summer resort so that the unfavorable weather conditions of midsummer which have been used against its remaining in its present location will not stand. From a taxpayer's standpoint the $10,000,000 cost of removal, which it has been charged is a fair estimate, should be sufficient to defeat the proposition.

NEW WALNUT BLEACH.

Considerable satisfaction is expressed on the part of walnut growers of California over the new method of bleaching walnuts. The process consists of a solution of salt so treated by electricity that the chlorine is liberated and the nuts are bleached even better than by the old patented process and with none of the injurious effects. Ten of the seventeen walnut growers' associations of California have arranged to use the new method. Probably most of the remainder will do so, though the process will not be unanimously used this season. This will be principally because of the difficulty of getting the patented cells in sufficient quantity to supply all the associations. It is predicted that another year will see its use universal.

THE TORRENS LAND TITLE SYSTEM.

On another page of the Cultivator may be seen an article by Mr. Leavitt, in which he treats of an excellent system which was killed, so far as California is concerned, by being lumbered up with so much red tape and such high cost. This system as carried on in Australia has led to a feeling of security as to the title of the land and a simplicity of transferring realty which is very satisfactory and economical. The lobby in the California legislature succeeded in loading such a heavy cost upon the system here that we believe it has never been used or at least but very slightly.

We trust the matter will be agitated and some of the red tape and the excessive cost spoken of by Mr. Leavitt may be dispensed with.

"The extraordinary interest that is now taken in alfalfa is justified by the extraordinary value of this great wealth-producing plant. This year the value of the alfalfa crop for hay alone is supposed to be $100,000,000. If the extensive experiments now in progress are as successful as they promise to be, the area on which this crop may be grown will be greatly extended. Its cultivation is moving eastward, and the plant is making its way even in Indiana and Illinois. It has wonderful values. With a yield per acre twice that of hay, and more nutritious than hay, it has no superior as a forage crop, a milk producer and an egg producer. But, from the point of view of national prosperity, this is not its only nor perhaps even its chief merit. It is one of that wonderful group of leguminous plants that gather nitrogen from the air and impart it to the soil. The introduction of such plants throughout the country will be a factor of great importance in our future prosperity, saving our good soils from deterioration and helping powerfully to renovate those that are run down. From the extension of the cultivation of this one group of plants will come added values of hundreds of millions of dollars annually to our agricultural wealth."—Secretary Wilson.

It is said that the prices of California canned fruits have become so high during the past few years that the exports, especially to England, have vastly decreased. It is thought that this year will find the output somewhat larger.

Shop Talk

DRY FARMING BOOK.—As was suggested last week, editorially, now is the time to think of next year's crop and how it is to be handled. There is much more dependent upon the preparation of the soil for seed than many farmers know about. Especially in the West where the rainy season is a little uncertain, knowledge along this line is of great value.

As has been suggested before H. W. Campbell's "Dry Farming Manual" seems to fill this need and the **Cultivator** is receiving orders for it. For a short time we are going to make the **Special offer** of a years subscription with the book at the regular price of $2.50. The manual is the 1907 issue and is the latest out. There will never be opportunity to get it at a better figure than this and we suggest that all interested take advantage by remitting and renewing at once.

Agricultural Notes of the Pacific Coast

Northern California

Humboldt county's big fair is in session at Eureka this week.

Ferndale held its thirteenth annual fair with good attendance last week.

Woodland is quite puffed up over the large number of premiums won by Yolo county shorthorns.

The daily shipments of beets to the Hamilton factory are increasing.

A farmer at Milton, Oregon, cleared $40.00 per acre on his 300-acre wheat field.

The crop of rice near Willows is said to be giving promise of a large production.

Blight has made its appearance among the tomato fields of Haywards, Alameda county.

The state tax rate of 40 cents is said to be one of the lowest ever established in this state.

Oroville is taking steps to have a citrus fair this fall which will rival anything held in the state.

A large company of cattle raisers of Trinity county expect to establish a creamery at Trinity Center as soon as possible.

The fire in the vicinity of the Big Tree forest has been subdued and only a very small number of the monarchs have been injured.

A vineyard of 1100 acres of Tokay grapes between Florin and Elk Grove, Sacramento county, is the largest of its kind in the world.

Grape Growers' Association of Lake County is now permanently organized under the auspices of the California Grape Growers' Association.

Dairymen in the vicinity of Galt, Sacramento county, have organized for the purpose of improving the quality of the cream and securing the best possible returns.

A large dam is to be constructed on the Bear River, Lone Star district, Placer county. It will require six months for construction and will largely increase the irrigated area of that section.

The Yuba City cannery recently beat its previous record when in 13 hours its working force put up 64,953 cans of peaches. This required a total of 60 tons of peaches and 400 employees to do the work.

Sacramento Valley Development Association will be represented at the National Irrigation Congress at Albuquerque by a lecturer who will with the aid of stereoptican views make known the merits of that valley.

Bids were recently opened by the Sacramento Valley Development Association for the construction of the East Park Dam on the Orland irrigation project. The bids range from about $65,000 to nearly $150,000.

Plans are already being laid for a bigger and better state fair next year, one factor which calls for immediate action being the construction of a new pavilion to take the place of the old one which has heretofore been on the State Capitol grounds in the city.

The proposition of the wine men to the wine grape growers to crush the grapes and store the wine until next May on the plan of "on shares" has fallen flat, the growers practically all refusing to co-operate. It now appears many grapes will not be picked.

Central California

Shipment of apples from the Pajaro Valley is now in full blast.

Bakersfield Fair funds are now up to nearly $2500 and it is definitely decided to hold a fair this fall.

The J. K. Armsby Company is endeavoring to buy the entire holdover raisin crop of the Fresno growers.

It is estimated that the almond output of Acampo, Woodbridge and Lodi, San Joaquin county, will be about 350 tons.

It is claimed that more than 125 carloads of apples will be shipped from Watsonville to the city of Los Angeles.

Raisin growers of San Joaquin Valley are having trouble with Jap laborers who are unreasonable in their demands.

San Jose Grange, Number 10, proposes to get after Congressional candidates and pledge them to support parcels post.

One eucalyptus nursery at Tulare claims it will have over 2,000,000 eucalyptus trees ready for the next season's planting.

A Bakersfield rancher planted corn on heavy Bermuda grass land June 26, which is now 15 feet high and making the finest of ensilage.

Since the seeded raisin trust has purchased the patents on the new seeder the royalty on seeding has been raised from $5.00 per ton to $20.00 per ton.

The Salinas Sugar Factory started on its full time run September 15th Beets had been delivered at the factory for some time prior to that date.

The winery at Sanger began its season's run about the first of the month, but the low price offered for grapes prevents any very rapid delivery.

Some of the largest vineyards near Fresno will lose a large amount through the Japanese contractors failing to live up to the contracts made earlier in the season.

The firmness of eastern markets regarding prunes and apricots is having a good effect on the local market and a number of sales of both at a fair price have been made.

At a recent meeting of the Orchard City Grange at Campbell, Santa Clara county, a collection of Argentine ants was presented and information given regarding their habits and manner of control.

The California Fruit Exchange is meeting with considerable opposition at Lodi because of having placed inspectors in the various grape packing houses so as to secure a more uniform and satisfactory pack.

The California Wine Association finding its offer to crush grapes and store the wine for the growers received with so little favor has finally withdrawn it and is now offering to buy on the installment plan, $3 per ton down and the balance on time.

Wine grape growers are as a rule incensed at the attitude of the California Wine Association in refusing to buy grapes this season. It is charged that the association is hammering down these prices for the purpose of doing politics and forcing the growers into line against the temperance agitation.

Southern California

Beaumont is planning for an apple fair in October.

Riverside has found two separate infestations of the Argentine ant.

Walnut growers generally will this year adopt the new salt bleaching process.

The first car of lima beans out of Orange county this year was shipped on September 5th.

The Jurupa Nurseries at Riverside have been sold to the Orange County Nursery and Land Company.

"About equal or possibly larger than last year," is the usual verdict regarding the coming orange crop.

Two prominent young men of Redlands were recently arrested for being careless with camp fires in the forest reserve.

Ranchers controlling the large stock ranges in the mountains of Ventura county have suffered heavy losses from stealing of horses in the last few months.

Orange county has one field of beans of 23½ square miles, or over 15,000 acres. This is on the property of the San Joaquin ranch company, which owns 108,000 acres.

The Soboba Indian reservation near San Jacinto has recently received a $5000 appropriation to aid in the development of water for irrigation of the land of the Indians.

The University of California has an expert in the Ventura county bean fields conducting experiments in the selection of beans so as to secure an earlier bean of high quality.

Now comes a prominent grower of Redlands who says that the proclaimed endorsement of Senator Perkins by the Citrus Protective League is absolutely without foundation.

It is estimated that Southern California will produce this coming year between four and five thousand cars of Valencias. An effort will be made to discourage continued heavy planting of that variety.

The Pomona Fruit Growers' Exchange recently elected the following directors for the coming year: H. J. Nichols, Mel Campbell, J. H. Graber, Fred Smith, J. M. Mitchell, F. P. Firey, J. G. Robertson.

The officers and directors of the San Dimas Citrus Union for the coming year are: D. C. Teague, president; E. W. Hart, vice-president; L. H. Bixby, secretary; Bank of San Dimas, treasurer; W. A. Johnstone, W. C. Sheperd Jr.

A large number of officers and members of the Citrus Fruit exchanges of Southern California will attend a meeting at Kansas City September 29-30 and October 1 which will also be attended by a large number of the eastern representatives of the exchanges and discuss methods of handling the citrus output for the next year.

Delegates from the various walnut associations of Southern California met in Los Angeles Tuesday morning and after deliberation recommended the following prices to the various associations:

No. 1 softshells, 12½c; No. 1 hardshells, 12c; No. 2, both hard and softshells, 8½c. All prices to be subject to 1½ per cent. discount to trade.

The Coast

A large tract of land near Milton, Oregon, has been subdivided into small fruit ranches.

Portland, Oregon, recently shipped by one steamer $153,600 worth of wheat to Queenstown.

Fruit packing houses at Freewater Oregon, are busy with over 300 people sending out fresh fruit.

The little city of Vollmer, Idaho, contains over a million bushels of wheat in its store houses.

Freewater, Oregon, forwarded during the height of its peach picking over five cars of packed peaches daily.

The outlook for fruit about Emmett, Idaho, is very promising. Crawford peaches especially were magnificnt crop.

One of the five large flouring mills at La Grande, Oregon, has begun grinding on the present year's local wheat.

The annual Agricultural Fair of Okangogan county, Washington, will be held at Riverside September 28, 29 and 30.

Fruit inspectors at LaFayette, Oregon, are cutting down and destroying diseased fruit trees of non-resident growers.

A rain storm visiting the country near Colville, Washington, at the end of August is estimated to be "worth $1,000,000 an hour."

The treasury of the state of Washington is embarrassed owing to large payments for coyote scalp bounties paid out during the last year.

Freewater, Oregon, and the people of all Walla Walla and Umatilla counties will hold a peach carnival at Freewater the end of this month.

One canner at North Yakima, Washington, proposes to put up a $65,000 pea canning factory providing he is guaranteed 700 acres of peas the first year the factory is built.

The first new wheat delivered at Waterville, Washington, was on September 4 and was bought by the Wenatchee Milling Company. The wheat ran full sixty pounds per bushel.

It is estimated that the apple country of the Inland Empire immediately surrounding Spokane will ship 8000 cars of apples this season, and the estimate is made of 10,000 cars next year.

Bee keepers at North Yakima, Washington, are appealing for a law to protect the honey interests of the state of Washington. Primarily they are asking for the appointment of a state bee inspector.

One firm at Spokane offers $10 each for 50 boxes of fruit to be chosen from the winning car of apples at the National Apple Show. They also promise $5000 for the remainder of that one car of fruit.

The recent meeting of the National Wool Growers' Association at Salt Lake City took steps looking toward the establishment of national storage of western wool and a committee was appointed to select a city for storage.

Farmers near Nome, Alaska, are succeeding in growing watermelons. A tourist from there reported exceedingly fine fruit which he ate at that point on August 18. Corn stalks in the same section at that time were seven feet high.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

BONE AS A SUBSTITUTE FOR GRIT.

MY EXPERIENCE regarding the value of grit in poultry economy is that when hens are fed plenty of cracked bone the need of other forms of grit has never been manifest. A hundred pounds of crystal grit and similar forms of quartz rock found on the market, have absolutely no food or fertilizing value and cost from $1.50 to $2.00 per hundred. One hundred pounds of cracked bone, costing $1.75 to $2.00 per hundred, contains from 20 to 25 pounds of phosphoric acid, worth $1.40 to $1.50 as fertilizer after the hen has made use of it as grit. This same 100 pounds of bone contains some three to four pounds of nitrogen, which is found in the droppings of the hens and has a value of 25 to 30 cents as fertilizer. On the other hand a good sample of cracked bone will return to the soil of the orchard or garden nearly its original cost in fertilizer and at the same time provide the hens a substitute for grit that many good authorities claim answers all purposes. Oyster shells or quartz rock have absolutely no food or fertilizing value. It is true that oyster shells provide lime, needed by the hens, but cracked bone is equally efficient in this respect.

Along the same line Mr. Hunter of Farm Poultry, writes:

"The 'evidence' that grit is essential to digestion in birds consists of a general and time-honored impression that fowls instinctively swallow grit because nature, having so constructed their heads that a set of suitable teeth could not be conveniently placed in the mouth, ingeniously made up the physical deficiency by providing the creature with an instinct to swallow 'teeth,' and rattle them around in the organ arranged for the reduction of the food which in some other creatures takes place in the mouth as the food is introduced.

"My skepticism as to the necessity for grit goes back to long periods when my fowls, being apparently in the best of condition without grit, were allowed to continue without it. I was not at that time interested enough in the point to investigate it. Some years later, about ten years ago, I began to experiment a little along that line, but found it impracticable to follow the matter on the scale and along the lines necessary to make a postive demonstration. The results, as far as I went, however, indicated that the prevalent notions of the necessity of grit were probably wrong. Later still I made an observation which could hardly be dignified by the term experiment on the use of grit and shell, which disclosed the fact that the particular lot of fowls observed would consume practically no grit when kept supplied with shell. In conversation with others who have given some thought and study to this question, I have found considerable of a tendency to skepticism as to the actual necessity of grit for a fowl in every way normal.

"It has not yet been demonstrated that fowls do not require grit to assist them in 'grinding' their food. Neither has it been conclusively shown that they do. The indications that grit is not essential are sufficiently numerous and of such nature as to make it advisable for the advocates of the theory that the hen must have grit to be very cautious about emphatic statements of their views.

"Personally, I anticipate that a time will come when the habit of swallowing 'grit' or any 'foreign' indigestible, non-nutritious substance will be recognized not as a natural instinct, but as an unnatural impulse, and that the investigations which lead to such conclusions will throw some needed light on the subject of feeding and digestion."

* * *

POULTRY BREIVITIES.

If you would have the birds grow well keep the goslings and ducklets growing all summer.

* * *

Chicken cholera is frequently caused by stale and filthy water in ponds or drinking places.

* * *

At this time of the year the pullets that are expected to lay winter eggs should have special attention.

* * *

It is a mistake to have turkeys, chickens and ducks in the same houses and yards. Their habits differ, and they should be kept separate to make success of each and avoid disease.

* * *

Pure air is needed in houses and coops to develop fine plumage in young poultry. To prevent odors in roosting quarters, fine, dry earth and coal ashes are good, sprinkled under the perches.

* * *

Contamination Theory.

Will a leghorn cock, running with Buff Orpingtons contaminate the future progeny of such birds even when the Leghorn is removed and a Buff Orpington cock is substituted? I am told that such is the case, and that these hens will never again produce pure Orpingtons even when associated with a hen and Orpington cock Any information you can give on the subject will be appreciated.—E. M. K.

This theory that the male may have an influence on future progeny of the mother is an old one and keeps cropping out from time to time in spite of the fact that no well authenticated evidence has ever been produced to substantiate the assertion. —S.S.

* * *

Turkey Troubles.

Can you tell me what is the matter with our young turkeys? Their crop hangs down as big as a quart cup. We opened one from the outside and found it filled mostly with water, thick and brown, with a terrible odor. There was also some barley and alfalfa that had been eaten that day. They seem to eat as well as ever and take as much exercise as usual. In a flock of a hundred there are ten so afflicted and more starting. We sewed up the one we opened and in three days it was as full as ever again. We did not feed it for a day, then soft feed. —G. T. I.

It is probable that these young turkeys are suffering from inflammation of the crop. I am unable to say what the cause may have been but would shut the affected ones in a yard and supply them with water that contains a disinfectant, ten drops of carbolic acid to a pint of water will do, or Douglass' mixture in the drinking water. The drinking fountains should

be kept clean and if Douglass' mixture is to be used it is better to use earthen drinking fountains. I would feed them dry food in rather limited quantities. If you decide to open the crop and empty the decaying material before sewing up again, rinse well with a disinfectant. Peroxide of hydrogen is excellent for this purpose. Douglass' mixture is prepared by dissolving four ounces of sulphate of iron (green vitriol)in four quarts of water, and to this add one-half ounce of sulphuric acid. In using add a teaspoonful to each pint of drinking water.

* * *

Molting.

Can you tell us what is the cause of year-old hens, S. C. W. Leghorns, molting early in July, getting a new coat of feathers, laying a few eggs, then remolting and continuing in a state of partial molt for the next four months? We had a flock of fifty that acted in the manner described last year and we failed to discover the cause.—E. C. H.

Starving the hens for a period of from ten days to two weeks will start the molt at any time during the spring or summer. Then feeding heavily on food rich in protein will cause them to feather quickly, but my experience is that they will continue to molt more or less feathers during the season, and they may make a complete molt later in the season. A continuous feeding of highly concentrated rations will sometimes cause an almost continuous state of molt.—S. S. T.

* * *

Roup.

Is there any cure for rattling in the throat among hens?—Subscriber.

Rattling in the throat is usually caused by the catarrhal condition that accompanies roup, and while these hens may appear to be in a fair state of health—eating well and laying more or less eggs, still such a bird carries about in her body the active cause of roup and is capable of transmitting the disease to other hens and chickens. I doubt if a bird that has once had roup ever fully recovers. As an egg producer she is always inferior to the bird that has never suffered from the disease. Her development is much slower and in every way such a fowl is handicapped through her entire life. If I had birds that were suffering from throat trouble of the character mentioned, I would dispose of them and start new by disinfecting everything thoroughly. And in securing new stock I would convince myself that the stock comes from flocks that are absolutely free from roup, and to be doubly sure when I was convinced that my own premises were free from the cause of the disease. I would secure eggs from healthy flocks and hatch them in my own incubators and never allow a strange fowl on the place that had not undergone a period of quarantine sufficiently long to insure against an active outbreak at last. The active treatment of the disease as manifested in these birds should consist of the general treatment of roup as outlined in recent numbers of the Cultivator. Among these remedies kerosene oil holds high rank and can be used in various ways, among which the following may be mentioned: A film of oil may be poured on a dish of water and the head of the bird dipped in the same and held there for an instant, withdrawn and wiped dry. Coal oil may be injected into the nostrils with a medicine dropper. Wheat may be soaked in coal oil and fed to the ailing birds. The drinking water should contain a disinfectant, but it should be borne in mind that when the bird is cured it will never be the equal of a bird that has never suffered from roup.

TRAP NESTS IN SUMMER.

When the trap-nest idea first began to attract notice, the chief claim made for them was that by their use the poultryman could know which hens laid, and how many eggs each hen laid during any given period. Then it was learned that any device that would "show which hen laid the egg" also made it possible to keep track of both the sires and dams of the chicks—or in other words to accurately "pedigree" the stock. Clearly it is of great importance to know the individual ancestry of the chicks, both on the male and the female side.

As trap-nests came to be better known, and all types of poultry keepers found them to be useful, a number of other advantages incidental to their use were developed.

It has been learned by means of the trap-nest that many hens rarely, and sometimes never, lay a fertilized egg. By marking each egg that is intended to be used in incubation with the layer's leg band number, those hens which lay non-fertile or weak-germed eggs can be detected, and their eggs avoided.

It is no new discovery that the hens which lay well during the fall and winter months are the ones that pay best from the market egg standpoint; but when we analyze the detailed egg-records of several hundred individual hens, recorded by many different trap-nesters, we find that the best fall and winter layers are also, as a rule, the best summer layers. By "best winter layers" we mean the individual hens that lay from twenty to twenty-six eggs per month; we learn that the genuine "persistent layer" as an individual is pretty certain to lay prolifically the year round.

The work of these superior individuals is obscured, passes unnoticed, when the flock-record is taken as the unit; when the individual record is taken we find that the most persistent layers are apparently checked by nothing except broodiness and the moulting period, and decidedly less by those functions than are their less prolific mates. Such are the facts disclosed by a study and careful comparison of a great many trap-nest records, made in various sections of the country during the past seven years. As compared with individual records the flock-records are practically certain to be misleading, and our conclusion from them incorrect.

Poultrymen who have never handled the individual hen as a unit, but judge the matter wholly by the records of flocks as a whole, have frequently claimed—and have found apparent reason to support the claim—that the type of hen which lays well in winter is not the type that lays well in summer; but trap-nest records of flocks that have been competently handled for eggs all through the year do not support that theory. The hen that does not lay freely and profitably in summer when properly handled, does not, as a rule, show up on the trap-nest records as having laid remarkably well either the previous or following winter. There are exceptions, of course, but they are relatively few. It is a most excellent idea to keep the stock carefully culled of drones and moderate layers all the time, summer and winter. It is the "persistent layer" that pays the year 'round profit in market eggs, and she is the true "laying type" that trap-nesters count upon to perpetuate the prolific laying habit of their stock.

Summer has its own peculiar conditions that antagonize egg production, and the profits are shrunken unless the adverse conditions are overcome. The "strictly fresh egg" is always in demand.

What's the difference?

Genasco is as different from other roofings as wool is from shoddy, or gold from pyrites.

You can't always tell from the looks, but the difference soon shows in the wear.

Genasco Ready Roofing

is made of Trinidad Lake Asphalt—Nature's everlasting waterproofer. Other roofings are made of—who can tell? Ask your dealer for Genasco. Insist on getting it. Look for the trade-mark. Mineral or smooth surface. Write for samples and Book 35

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

mand, but eggs which are allowed to remain in a hot nest covered by sundry hens that visit the nest throughout the day, lose considerable of their first freshness by night; whether the eggs are to be incubated, marketed soon, or held in storage for future marketing, their quality has been lowered. Trap-nesters remove the eggs from the nests from three to five times during the day; as a rule the trap-nest is an individual nest, and the layers are not able to crowd two, three or more at once upon a nest of eggs, overheating eggs and hens, both, as is frequently the case where the ordinary box nest is used.

Then again, trap-nesters have found by experience that summer troubles with broody hens are greatly lessened by judiciously handling the traps. The frequent handling of the layers and prompt removal from the nest seems to diminish their brooding inclinations and they are more easily "broken up" when they do become broody. Many persistent layers in the incubating breeds do not become broody at all when using the trap-nests, but continue to lay right through the summer. "Egg eating is a vice practically unknown where these nests are used," is the report of many who have had long experience with good trap nests.

It is an interesting fact that quite a number of the most successful trap-nesters installed and began to use trap nests during the summer months. By fall they had become quite familiar with their use, and were in a position to exercise good judgment in trap-nesting and culling the pullets, and the yearling hens through the moulting period. It will be found that the great layers are remarkable for a tendency to molt without apparent loss of vigor, and they will continue to lay during a considerable portion, or the whole, of that period.

It certainly is an excellent plan to get the trap nests installed during the summer months, become familiar with handling them without loss of time, and then one is prepared to start the new generation of layers upon the right road.—American Poultry Advocate.

TRAP NESTS.

This trap nest anyone can easily make. The gate consists of a rectangular frame of heavy wire which meets at the center of the hinge side and one of the pieces is bent outward at right angles to the door. The end of this projecting arm is best bent back upon itself to prevent injury. The frame of wire is covered with wire net and fastened with two staples for hinges to the side of the opening with the gate projecting straight out and the arm across the opening. When the hen enters, the light door closes behind her on the turnstile principle and catches on the wire catch on the left side. The box should be large enough so that a low partition may be put across, the back part being used for the nest. The experiment station at Orono, Maine, sends out a bulletin on trap nests.

Never have the nest so constructed that the hen must jump down into it, as broken eggs will be the consequence. Rather place the entrance so as to permit her to walk in upon the eggs.

Washington farmers are discussing the advisability of a law looking toward the compensation of stock growers whose stock has been destroyed because of its being diseased.

Small Fruits and Vegetables

SEED ROT OF POTATOES.

REPORTS have already begun to come in of seed potatoes rotting in the ground. This trouble is caused by a fungus or mould that attacks the piece of tuber in the ground on the cut surface. The disease was so bad last year in some fields that ninety per cent of the seed rotted in the ground. In some cases this rot started so soon as to prevent the pieces of tubers from sprouting at all. In other cases it started later, rotted the seed, then the fungus attacked the stem. Plants may be found in any field during the season more or less affected with this disease. The plants lose their green color and the edges of the leaves turn yellow or die. If the stem be pulled up, the bark will be found all right, but the splitting of the stem longitudinally wil show the sap wood of the stem colored brown or yellow or in the last stages of black. Microscopical examinations of a cross section of the stem will show the fungus growing in the cells and across the sap tubes of the stem. The injury, to a large extent, at least, comes from the clogging of the sap circulation by the hyphae of this fungus.

This plant, or fungus, that causes the disease, is one of the species of Fusarium, the same or similar to the one that causes the blight or so-called "sleeping-disease" of the tomato. No direct remedy is known for it. One fact that is of some assistance in combating it is that the disease is much more prevalent on land previously planted to potatoes than on alfalfa or clover land. Another thing that is quite noticeable in studying the nature of the disease, is that potatoes planted whole are not attacked to such an extent as the cut ones because of the inability of the fungus to get into the stem.

Treatment of seed with formalin, corrosive sublimate, sulphur, lime, etc., have not given any perceptible relief from it.

It is probable in many cases at least much of the disease is carried to the field in the seed potatoes. The same fungus causes the "dry rot" of potatoes in the storage cellars. It has been very noticeable during the past winter that cellars with poor ventilation, no matter how cool and dry they were, had a high per cent of potatoes affected with this dry rot. Good ventilation and a low temperature without danger of frost in the cellar is probably the best safeguard against loss from this cause—E. R. Benett, Potato Specialist, Colorado Experiment Station.

ENDIVE INSTEAD OF LETTUCE.

One of the most delicious salad plants in the world is the endive. It is the French chicory and some day when it is thoroughly known in America it will largely supplant our more common lettuces.

There are two varieties—the curled and the broad-leaved. The former is the more tender. It matures slowly, requiring about seven weeks and can be sown so that it will come in during the heated months, when lettuce is at its poorest.

Plant the seed fairly close, and as soon as a few leaves are up begin to thin, using the thinnings for the table. Continue this thinning daily till the plants that are to remain and grow to maturity are at least one foot apart.

As soon as the leaves are four inches tall, you may begin to pick. Or the leaves can be cut off and the plant will grow others. Picked this way, endive is at its tenderest.

If it is allowed to grow into heads, the stalks should be blanched. This is done by excluding the light from tnem either by heaping straw or hay around the base of the plants, by covering with boards or most easily and best by tying the heads. Be careful, however, never to perform any of these operations at a time when there is a dew or rain on the plants. They must be perfectly dry when handled.

If the heads are tied up, the blanching process should be complete in about 15 days, sometimes earlier. As soon as they are blanched the endive should be used.

PRESERVING SMALL FRUITS.

An account is given of the coöperative growers of New Zealand preserving their small fruits by employing an improved method. The fruit is placed in casks holding about three tons, the whole mass being stirred with beaters and at the same time sulphur dioxide is forced in at the bottom and the gas is disseminated through the whole mass. The fruit thus treated is chiefly black currants and raspberries. It gives the fruit a bleached appearance, and when it is boiled the sulphur fumes pass off and the fruit takes on a bright natural appearance. In making the jam, it is boiled about twenty minutes before the sugar is added, so as to drive off the sulphur.

Sulphur dioxide is made by adding strong sulphuric acid to copper. The result is bluestone (copper sulphate,) suiphur dioxide and water. Sulphur dioxide is rapidly absorbed by water. The substance is harmless, as it is composed of two parts oxygen and one part sulphur. It is a heavy gas, and collects in the bottom of the vessel and is driven up through the mass by heat, leaving the product pure and with a bright fresh color. The effect of the process prevents the oxidation of the mass. which is the process that darkens preserved fruits.—J. W. Mills.

The Ornamental Garden

SHOWY PLANTS.

ABOUT the middle of December, the most gorgeous plant to be seen in California gardens is Poinsettia Pulcherima. It might be called a most gorgeous tree, for in size here it is a tree. It is not uncommon to see it ten feet in height with a spread of fifteen feet. The branches of these large plants are numerous and each one is terminated with bracts of the most intense and brilliant scarlet, the largest of which measure from 15 to 18 inches across. They bloom for three months and are invaluable in our gardens—having a brilliant effect, and bloom most profusely when other flowers are scarce.

They are popular for decoration and ship reasonably well. When withered, if they are put into hot water they will revive and keep fresh a day or so. The plant is the sumac of the western states. After losing its foliage it should be cut back to within a few eyes of the old wood. It grows readily from cuttings, which here can be started in the open ground. On large grounds it is very effective planted in groups.

There is a double variety which bears brilliant rosettes of floral bracts the same as the single, but much more beautiful. It is very rare. There are two or three single varieties, the difference between them being in the size of the bracts and variation in the shade of the coloring. There is also a white variety which I have not seen, so that I cannot say how it compares with the scarlet. The stem of the Poinsettia on the large plants often measures from 12 to 15 inches in circumference.

Another plant remarkable for its handsome red flowers, a summer bloomer, is Erythina Christi Galli, or Coral Tree. It is deciduous and rests three months during the winter. The flowers are very large, pea-shaped, brilliant red shaded with maroon. They grow in spikes not infrequently measuring two feet in length in large specimens. When in full bloom this splendid tree is a most striking object. It is propagated from seed or well grown cuttings. A seven year old plant from seed, if full grown, will form a tree, measuring 18 inches in circumference, 12 feet in height, with a spread of 20 feet. It should be trimmed back every year, thoroughly cultivated and the soil enriched, as should all plants of strong growth.

Nandania Domesticus is a very beautiful shrub with ternately compound leaves growing around a central shoot, at first of a beautiful dark, red color, and afterward changing to a dark green. Sometimes the young growth is green, shaded with brownish yellow, and the plant has at all times foliage in different stages of growth and even so that the effect is very striking. The foliage is very pretty for boquets, is very handsome pressed and is fine for decoration. The flowers are in terminal compound panicles, white, with yellow antlers, and the plant is said to have red berries about the size of peas, though I have never seen them. Its habit is quite peculiar, every shoot coming direct from the root to the height of several feet, like canes. It never has any branches so that it is very circular in growth and always symmetrical. It is a native of China and Japan, where it is grown very extensively. It was first introduced to cultivation in 1804. It is propagated from cuttings of the well ripened wood, or by shoots which it throws up every year. In this way it spreads but not very rapidly. It is rarely seen in gardens. It is quite hardy here, and never affected by cold weather. It is liable to be troubled by scale if not watched with care and properly cultivated and thoroughly watered at intervals.

No insects infest poinsettia or Coral Tree, which is greatly in their favor. I have never known the Poinsettia to seed in this country, though I notice seed is advertised in foreign catalogues.—T. B. S.

FLOWER BETTER THAN FLY PAPER.

Migonnette a substitute for fly paper! Surely, of any remedy for any bad condition, that announcement has a delightful sound, says the New York Press. A woman living in the country asserts that in a room where pots of migonnette are set flies will not linger. "Instead of placing those annoying sticky sheets of paper about the room," says an experienced woman, "or undergoing exhausting exercise of driving the pests out of the place through windows, the blessed plant just seems to blow them out on a wave of what you and I would call its fragrance."

North Yakima has a large Jap colony which has taken up quantities of land for garden and fruit purposes.

Malthoid Roofing

Mr. W. T. Somes, Proprietor of Bimini Hot Springs Hotel, Los Angeles, Cal., U. S. A., writes as follows: "Our hotel building, a flat roofed structure covered with Malthoid Roofing, is situated quite near the large Bimini Bath Houses that burned so fiercely the night of November 15th. The wind carried the blazing shingles and red hot cinders in showers to my building, where they simmered on the Malthoid Roofing and went out, doing no damage beyond a number of small blisters raised on the surface of the roofing. We have had one rain since the fire and the roof is tight."

Pruning Grapes.

How many canes and buds and eyes do you leave in pruning the following vines: Emperor, Malaga, Muscat, Tokay and Thompson seedless. The writer has a vineyard at Imperial 4 years old. What is the size of raisin trays?—G. V. R.

Emperor vines are trained to five-foot stakes and two or three buds are left until long spurs are formed. When the top grows too heavy, the whole spur is removed to give room and not the pruning merely shortened in. Malagas are pruned half high to three four-foot stakes, after a few years become strong enough to do without stakes. Two or three buds to a spur. Muscats are low pruned and short pruned two buds to a spur. Thompson seedless may be pruned like Emperors to a six-foot stake, or they may be headed lower and trellised on three wires cutting back each year to the old wood on the wires, leaving one bud only. It is impossible in a brief way to tell anyone how to do these things properly. One must understand the system to which they wish to work and then apply it to the different vines as nearly as they can, for no vine is exactly perfect. Raisin trays are two by three feet, usually cleated on both sides with the boards two feet long. M. E. S.

Overheated.

My horse has been suffering from heat. Pants all day. Will not sweat and cannot endure sun.—Imperial.

The horse suffering must be put in a shady place and have his nose, mouth and face well sponged off, put wet cloths along the spine and over the back and above the kidneys. Put water on his head and keep it wet to cool by evaporation. Do not give him any large amount of water at one time. Cut out alfalfa and feed him as small a quantity as possible for a couple of days of cold bran slop. He should be watched carefully, for there are two distinct classes of this trouble, one in which great weakness follows and the horse must be stimulated on eggs with milk and whiskey given as a drench. Three eggs, a pint of hot milk, a tablespoonful of whiskey every three hours. The other form the animal is not weak, but shows the kidneys to be out of order, these the bran mash quickly bring out. The cause is often found in young horses to be too much alfalfa. We do not like to feed alfalfa hay during very hot weather; we reserve it for winter feeding. Good grain hay with a small amount of rolled barley will ward off this trouble when the weather is hot. During the winter the same horses will do well fed on full ration of rolled barley and alfalfa hay. M. E. S.

Grafting Walnuts.

Please tell me at what age it is best to bud or graft on to black walnut and which of walnuts is best variety and most satisfactory.—J. F. R., Santa Rosa.

Careful reading of Mr. Neff's article in last week's paper, which you had probably not seen at the time of writing your letter, will answer most of your queries. As to the age of the stock or the black walnut root, will say that they are sometimes grafted on the old native trees on the hillside and again in nursery row they may be grafted at one year of age. As to variety that depends upon the section, and we believe your own section has proved out the Franquette to be the best adapted. From Santa Barbara south to San Diego either the Santa Barbara soft shell or the Placentia Perfection are the only ones used.

Squash Bugs—Fall Potatoes.

Is there any remedy for squash bugs?

Fall potatoes planted in this neighborhood nearly all rotted in the ground. What is the cause and remedy—Subscriber, Princeton.

There is no satisfactory remedy for squash bugs. Paris green is often dangerous and never entirely satisfactory. Covering plants with mosquito bar netting or hand picking have been suggested and in small gardens may be effectively used.

We imagine the trouble with the potatoes may have been immature seed or possibly the seed may have been planted in ground with insufficient moisture which, with midsummer heat on the soil, would practically cook and cause to rot without ever sprouting. It is very difficult to get the seed sufficiently ripe for midsummer planting and requires a great deal of care in selection.

Strawberry Fertilizer.

Please tell me the best kind of fertilizer to give my strawberries. They had a good crop this year having been set a year ago last May and want to give them good fertilizing this fall or at once if you think best.—J.B., Highland.

One of the best berry growers of Southern California says that the time to fertilize strawberries is before they are planted, that is, by putting on several tons of stable manure to each acre of ground and plowing deeply, then giving perfect culture to the ground for a few weeks to get the surface into perfect tilth, the best results are had. The application of fertilizer to the surface of strawberry beds is not a complete success. However, if the ground was not orginally fertilized as suggested here it is possible that the application of a complete commercial fertilizer this fall would be advantageous. A light dressing of stable manure may be added, but stable manure is poor stuff for surface dressing on strawberries.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Pruning Apricots.

Please give the best time for pruning apricot trees. Is there any loss of sap or are the suckers any more liable to be plentiful or any other bad results in pruning shortly after the fruit is picked and leaves still on trees?—H. E. T., Santa Paula.

A great many follow the custom of summer pruning of the apricots and it shows more good results than almost any other tree handled in this same way. It seems to stimulate the formation of fruit buds and if the tree is given plenty of water the increase of buds next spring at blossoming time will be practically assured. The suckers of course will be much more troublesome if the pruning has been very severe, but that is a matter which can be handled if sufficient additional fruit is given to more than compensate for the extra labor. The "bleeding" or loss of sap is usually not sufficient to be injurious. For stronger wood growth give winter pruning.

Eradicating Mites.

I have bought a place where the barn, hen houses and other outbuildings are fairly alive with mites and lice, also fleas. Can you give a quick and cheap method of destroying these pests, also the disease germs in places almost inaccessible to paint and whitwash.—H. E. T., Santa Paula.

This is a most difficult problem to handle and can be done satisfactorily only by taking out everything movable and a thorough clearing away of all unnecessary rubbish and reducing the number of crevices and cracks in which the vermin hide as much as possible. After this is done the application of a very strong distillate emulsion or whitewash in which is a liberal supply of crude carbolic acid, if put on with a spraying machine will be successful. The spray enters crevices much more perfectly than when applied with brush. If the building may be closed sufficiently tight good may be accomplished by the thorough fumigation with burning sulphur. This has little result however in the ordinary barn with its wide cracks which would permit the escape of the fumes almost as rapidly as formed. Scattering of bubach or other insect powders may be of some little value.

Butter Won't Gather.

We have a fine Jersey cow which had a calf about three weeks ago. She has always seemed healthy but there seems to be something wrong with her milk. She has always been an excellent butter cow but this time there only raises a small amount of cream and it is more like melted butter poured over its milk than cream. The cow is fed altogether on alfalfa hay. Now can you give me any advice? She seemed to "clean" all right when the calf was born but a couple of times last week I noticed a bloody mucuous discharge.—L. H. W., Lodi

I think that if you have a place where the milk will chill down to 55 deg. or lower, the trouble may be corrected by putting warm water not hot into the milk pans and then pouring in the milk and standing the pans in the cool place. The reason the cream failed to churn at first and churned afterwards was probably that it needed more air to make it grow acid. The churning beat the air into it and the oxygen started the souring rapidly. Now after this wait until it is sour and then if it does not make butter within twenty minutes dilute with cold water and let it stand for a little time and try again. The easy way out for you would be to get some buttermilk from any of your neighbors and stir it into the cream the night before, then it would churn without fail. Better have some one that understands cows examine her for the trouble mentioned. I should use a wash to disenfect her internally. Better have the veterinarian take her in hand for this trouble, as one cannot prescribe for her at a distance.—M. E. S

Root Knot.

Is there any remedy for root knot on Loganberries? My young plants that were set out the past spring have knots on the stems and roots near the top of the ground, from size of small pea to as large as small apples. I have been pulling them off where I could get at them and spraying the roots and vines with Bordeaux mixture. Some of the knots are decayed and are full of small magots and small gnats or flies.—W. C. B.

If I had this case to deal with I should dig out the plants and burn them and plant new healthy vines on other soil. There is little hope of restoring these plants to health when they have reached the stage described in your subscriber's query. Q. A. L.

Skin Disease.

We have a cow that has several rough spots on her. The largest are on the flanks, in the same place on each. Each spot is nearly as large as a person's hand. They are wrinkled and have scales like bran. The hair on the spots is scarce. Is it something that needs attention, and if so, what will cure? Is the cow's milk wholesome for young children?—Mrs J. M. W.

The diseased spots are due to vegetable parasites or fungi in the skin. Would advise tincture of iodine painted on thoroughly twice a week and later once a week until it regains its normal appearance. Milk is perfectly healthy.

Breeding Goat.

Can you advise me how to treat a young milk goat that is too fat? She is eighteen months old and never bred I have had her nearly six months. We thought in August she was three months gone, but she is only fat. I do not suppose you have a goat specialist on your staff yet, but general knowledge may suggest something practical.

Some of my goats I can feed all they will eat of hay and every green thing upon the earth and a little bait of grain; and it only runs to milk and kids. This one would gladly eat much more than I give her, but she seems like a Plymouth Rock hen too fat to lay.

She gets hay and garden truck but no grain or roots. I have good alfalfa hay. Would a straight diet of that on short allowance reduce her? I am only feeding her twice a day now instead of three times. Would weeds such as wild radish and knot-grass be less fat-forming than hay or vegetables? I should like to starve her without her finding it out.

They have big yards to run in and take exercise. How long ought it to take to bring her down into good working condition?

I can take a scrawny, neglected looking animal and in a month have her so sleek and sassy her old friends wouldn't know her. But to reverse the process baffles me entirely.—B. A. R. Stocker.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

I should put her in a small pen and give her dry poor hay, wheat, foxtail or any sort of wild stuff. Give her plenty of fresh water and have salt convenient for her. The first two days give her all she will eat up clean, then begin to shorten the feed by taking away a handful each day, this is better than to make a violent change as the appetite will lessen gradually. When the amount of feed is reduced to two thirds pause there for a few days; if she is losing flesh still do not cut her down further but if she does not then take away a little more. It is safe to cut the food supply down to half if you take a month to do it in but it is not safe to hold the animal down long to that low diet. A fat heifer will not breed as a rule and a goat is probably the same condition. There are sometimes barren animals; about one per cent of ordinary domestic animals are said to be barren. In the improved live stock it will in certain strains run much higher.—M. E. S.

Sorghum—Grapes.

Would you kindly tell me when is the right time to cut sorghum sown broadcast for hay, to stack? What is the value for cattle feed dry and cured? Some claim here it will kill cattle. Also when is the best time to trim young muscat grapes? And how should grape vines be trimmed back, when growing; two or three years old?—Subscriber.

The sorghum questions I think are fully covered in the last two articles. in dairy page and are too long for the query column. The grape pruning questions are rather vague ones. In the winter when dormant prune the first year to one stem leaving a top bud and maybe one outstanding spur. Next year cut back to two or three spurs each year trimming off all below eight inches from the top, removing all ground suckers carefully right up to the vines. There is no particular reason for summer pruning of grape vines in general, sometimes where vines show lack of foliage or where winds are very strong they are shortened in to save breaking off.—M. E. S.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Tape Worm.

I have a valuable terrier which a few weeks since was most active and healthy. Later he seemed indisposed, ate only occasionally and at times would lie around in the dumps. Gave distemper remedy, later gave worm remedy. Seemed better for a time, but continues to run down and is very poor. Occasionally he will vomit. Other than that there is no indication of disease except his lying around and looking at us with big sad eyes. At first he had spells of shivering, but these do not come any more.—M.., Highland Park.

The symptoms are such as a dog would have if full of tape worms. Make a strong salt water solution and give an enema with fountain syringe. All he will possibly stand. Tie him where you will be able to watch results. Repeat in about a week.

Visalia is having a race war amongst the employees at the cannery.

California Farm Names

AFTER skipping a couple of weeks we come back with another bunch of farm names which are quite interesting and show that the interest in this department of the Cultivator is increasing each week. We trust the movement will continue until every farm home in the state is dignified with a name of its own.

"Deveron Grove," owner, E. S. Ingram, Pomona, Los Angeles county. Deveron Grove is on West Holt Avenue in that thriving city.

"Tracy Stock and Ostrich Farm," owner, Mr. & Mrs. William Tracy, Buttonwillow, Kern county. Mrs. Tracy writes: "Our ranch is a stock ranch consisting of three thousand acres, situated in the Artesian Belt, thirty miles from Bakersfield in Kern County.

"Some months ago we became interested in the ostrich industry, and, being unable to procure any birds in this state, we had a pair expressed from Phoenix Arizona. The birds have done well and we think this locality an ideal one for ostrich farming.

"As Mr. Tracy is very busy I have taken the responsibility of the ostriches. This is my first experience along that line but I am making a careful study of the birds and hope to make the industry a success in this locality.

"I have plucked the birds twice and manufactured the feathers into goods ready for the market. So taking up your valuable suggestion we call our place—The Tracy Stock and Ostrich Farm.

"We find valuable information in every issue of the Cultivator."

"Hazlecroft," owner, Mr. & Mrs. H. J. Painter, Glendora, Los Angeles county. Mrs. Painter writes: "We have been very much interested in your lists of farm names and hasten to send our own, which is so new that even our nearest neighbors would not know where to find us by name alone.

"Our home is so small, 10 acres, that Croft seemed to suit nicely, and by adding a slight deviation of Mr. Painter's name, Hazael we have "Hazelcroft," which so far as we know is a new title. A name post and the proper stationary will be identification enough for our little home—which is set to seven acres bearing oranges, two acres young lemon trees, and nineteen varieties of other fruit.

"Medawin Ranch," owner, E. W. Blakeman, Holtville, Imperial county. Mr. Blakeman writes:

" I take pleasure in adding to the list of ranch names you are preparing. We have named ours Medawin Ranch. Medawin is an Indian word meaning magic and we think it a name especially suited for a ranch in the Imperial Valley. We wish you continued success with your most valuable and interesting paper.

"Willow Dairy," owner, S. S. Farnsworth, Tulare, Tulare county. This ranch is located two and one-half miles south west from Paige on the Santa Fe Railroad in Tulare county. There is a creek running through the ranch with large willows along the banks and the principal feature of the ranch is the dairy which suggests the name.

"Mistletoe Ranch," owner, B. Howard Whitcomb, Holtville, Imperial county. Mr. Whitcomb writes: "I am much interested in your 'Farm Names.' I named my ranch on account of the large quantities of mistletoe growing on the mesquite trees. I think every farm should have a name. I own a farm back in Indiana known as the, Burr Oak Stock Farm, so named on account of burr oak trees. I once owned a farm which I named 'Red Ear Stock Farm' on account of a husking bee. Its a pity so much mistletoe is going to waste here in this valley for want of pretty girls! Long may the Cultivator wave."

"Dogwood Ranch," owner, Arthur S. Fell, El Centro, Imperial county. The ranch is two miles north and two miles east of El Centro and consists of 320 acres, the principal features of which are alfalfa, dairying and grape growing. Mr. Fell says that he expects to plant oranges as soon as conditions of Imperial Valley are proved to be favorable to them. The name is taken from the fact that the ranch is located on Dogwood canal.

"The Oaks," owner, C. E. Moore, Yuba City, Sutter county. Mr. Moore writes that "The Oaks is situated five miles west of Yuba City and consists of 315 acres. The land is devoted to raising grain, alfalfa and stock. The name of the ranch is taken from the ten giant oaks, all of which are in the corral around the place."

"Far View Berry Ranch," owner, J S. Bates, Highland, San Bernardino county. Mr. Bates writes that he is pleased with the ranch naming idea and that he has taken the name Far View from the fact that from his door he can see all over the San Bernardino valley, Redlands, the city of San Bernardino, Colton, Highland, and Patton. His principal products are berries and small fruits.

"Palmetto Orange Ranch," owners, Mr. & Mrs. C. R. Rice, Lindsay, Tulare county. Mr. Rice writes that he has the border of the place along the street and private driveway lined with palms from which he takes his name "Palmetto." The place consists of 40 acres and is two and one-half miles east of Lindsay. Thirty acres of the place are in oranges and the rest is to be planted to oranges next spring, excepting such part as he has taken up with deciduous trees, grapes, and berries for his home use, also a small sized wood lot. Mr. Rice stands square up for his own community and he adds the following to his letter: "We have the best orange country in the State of California. We like the Cultivator and can't get along without it. We have taken it ever since we came to the state."

"Villa Alois," owner, A. Podrasnik, Uplands, San Bernardino county. Mr. Podrasnik writes his approval of the naming of the farms on beautiful heavy tinted linen paper with the words "Villa Alois, Upland California" embossed at its head. In the letter he says: "I see with pleasure that many of your subscribers have followed your advice in naming their ranches and in that way established an individuality for each place, I have named my home ranch, 'Villa Alois,' as above painted, nearly two years ago."

Orange county celery growers, members of the Celery Growers' Association during '06 and '07, will receive $29,000 for distribution, which was collected from railroads as claims for damages in shipments of celery to east during January, February and March of '07.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. R. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles. Cal.

FOR SALE MACHINERY OF ALL KINDS; new and secondhand gasoline & distillate engines and electric motors our specialty also generators. See us before buying. We can save you money. BAILIE AND BRANDT CO. 943 N. Main St., Los Angeles.

FOR SALE—DISTILLATE ENGINES FROM 3 to 80 HP new and secondhand, single and double cylinder, also all sizes of centrifugal pumps. BAILIE AND BRANDT CO., 943 N Main St., Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD. Box 6, Compton, Cal.

FOR SALE—CHEAP FOR CASH, SMALL gasoline engine ,in good running order Address B 9, care CAL. CULTIVATOR.

FOR SALE—COMPLETE LINE OF ELECtric motors and generators both direct and alternating current, BAILIE & BRANDT CO., 943 N Main St., Los Angeles.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL. Riverside, Cal.

POULTRY

SPECIAL SALE—TO MAKE ROOM FOR my young growing pullets I offer at common stock price all my this year's breeding pens, including many prize winners. This is a rare opportunity to get first class breeders cheap. At the last L.A.C.P.A. show my birds won all specials, all first prizes, and all seconds but one, that were offered on Barred Rocks. CHAS. E. SMITH Gardena, Cal. San Pedro car via Gardena to Smith's Crossing.

FOR SALE—STOCK OF THE FOLLOWING standard bred varieties of poultry, Black and White Orpingtons, Brown and White Leghorns; won fourteen first and second prizes on fifteen entries, State Fair, 1908. J. J. VERKOUTEREN, Route 3, Hanford, Cal.

PARTRIDGE WYANDOTTES—C. ANdrews, 823 W. Franklin Ave., Hollywood, Cal.—1st cock, hen, cockerel and pullet; 1 cups, Poultry Breeders' Show, 1908.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

WANTED—ORDERS FOR EUCALYPTUS trees for spring delivery. Write for prices. Seed of the Rostrata and Sugar gum for sale. ENCINITAS FLORAL & PRODUCE CO., Encinitas, Cal.

PIGEONS.

HOMERS FOR SQUAB BREEDING—ARE prolific breeders and are banded. Price $2.50 per pair. WM. CULP, Escondido, Cal.

SHOPPING BY MAIL.

SAVE MONEY AND GET A BETTER choice by shopping in a large city. We will do your shopping for you. Send for our free book. It tells you how. LOS ANGELES PURCHASING CO., 506 Bradbury Bldg., Los Angeles, Cal.

HOGS.

REGISERED BERKSHIRE AND POLAND China hogs, both sexes. C. A. STOWE, Stockton, Calif.

"Now, Johnny," said the Sunday school teacher, "can you tell me one of the most remarkable things Moses did?"

"Yes, ma'am," replied the bright youth," he broke all the ten commandments at the same time."—London "Opinion."

Turlock has a 50 pound watermelon.

CONTENTMENT.

Once on a time an old red hen
  Went strutting around with pompous clucks,
For she had little babies ten,
  A part of which were tiny ducks.
"Tis very rare that hens," said she,
  "Have baby ducks as well as chicks;
But I possess, as you can see
  Of chickens four and ducklings six!"

A season later, this old hen
  Appeared, still cackling of her luck.
For, though she boasted babies ten,
  Not one among them was a duck!
"'Tis well, she murmured, brooding o'er
  The little chicks of fleecy down;
"My babies now will stay ashore,
  And, consequently, can not drown!"

The following spring the old red hen
  Clucked just as proudly as of yore.
But lo! her babes were ducklings ten,
  Instead of chickens as before!
"'Tis better," said the old red hen,
  As she surveyed her waddling brood;
"A little water now and then
  Will surely do my darlings good!"

But, oh, alas, how very sad!
  When gentle spring rolled round again,
The eggs eventuated bad,
  And childless was the old red hen!
Yet patiently she bore her woe,
  And still she wore a cheerful air,
And said, "'Tis best these things are so,
  For babies are a dreadful care!"

I half suspect that many men,
  And many, many women too,
Could learn a lesson from the hen
  With foliage of vermilion hue.
She ne'er presumed to take offense
  At any fate that might befall,
But meekly bowed to Providence.
  She was contented—that was all!
—Eugene Field.

THE BONNET BOTANY OF PROF. ELI BOOP.

"YES, this must be the place," said Eli Boop to himself, as he paused at the entrance of a hall into which people, that is, women, were streaming. Mr. Boop had grown very nearsighted, even with his spectacles, and very deaf besides; on account of these infirmities he had experienced some difficulty in finding his way to the new quarters of his beloved Linnaean Society.

Thinking that he was late, he slipped into a rear seat. But the meeting had not begun. When it did open, he saw with astonishment that instead of his dear president, a fierce-looking woman was calling the meeting to order; and her remarks, so far as his poor ears could catch them, dealt, indeed, more with woman's rights than with botany. But he knew that he could no longer depend on his ears and eyes, and accordingly he waited patiently for fifteen minutes for the mystery to be explained.

Suddenly the dangling of a little flower under his very nose attracted his attention. It was a brilliant red flower on a long stem of vivid green; and it was drooping from a large bunch of similar flowers, red with green stems. Eli Boop, of course, was interested at once, and perplexed also; for although he thought that his knowledge of botany was nearly perfect, he did not recognize the plant before him by any of its parts. He took out his pocket microscope, instinctively, and was absorbed forthwith in a scrutiny of this strange specimen. "Flowers kermesine," he began, speaking softly to himself, "monadelphous—anthers anfractuose, pistils apocarpous—buds adventitious, stems, ramentaceous." He became more and more interested. "Leaves, biserrate, bracteolate, chartaceous, some hippocrepiform, lentiginose some hypocraterimorphous." The botanist seized firmly one leaf tthe strangest of all, and drew it nearer his spectacles. Surely, he thought, that was a remarkable species of plant life.

Just then there was a convulsive jerk given to the stem of the leaf, followed by a feminine shriek. Mr. Boop was startled by this, to be sure; but he was more startled when a large hat with ribbons and flowers descended into his lap. As he glanced up, he saw a tall woman glaring down at him in wrath, trying frantically, with both hands, to rearrange her gray curls at the back of her head. A moment more and the president was striding down the aisle directly toward Mr. Boop.

"Who are you?" she demanded, facing him savagely, while her followers arrayed themselves behind her in serried ranks.

"Boop is my name, madam," answered the professor, modestly.

"So it was not enough for you to intrude here. What do you mean by assaulting our honored vice-president, Miss Virginia Tool? Do you think to oppose woman's suffrage by violence? Do you think that brute force can conquer right?"

"No, no, of course not," assented the botanist, with a faint attempt at a good-natured smile. He glanced again furtively at the door. "My intrusion,

> "The world wants men, large-hearted manly men—
> Men to join in the chorus and prolong
> The psalm of labor and the psalm of love."
> —Holland.

madam, was entirely unintentional, entirely." He seized his hat nervously and slipping past the irate president, he made for the street.

Professor Boop was troubled more and more over Miss Virginia Tool. He told himself that he owed her an apology. He made inquiries about Miss Tool and succeeded in finding her abode. Then, one afternoon, he set out to redeem himself.

Miss Tool was at home, the maid said, and would receive him presently. After a while the door opened and Miss Virginia stood before him. She eyed him for a moment uncertainly. Then, with a scream, she threw up her hands. "O, you wretch! You wretch! Are you still persecuting a defenseless woman? Oh! murder! Help! Maria!" She turned and fled down the hall, still calling for Maria.

Reinforced by the giggling maid, Miss Virginia returned to confront the enemy. "Now, sir, go away, or I'll call the police," she ordered.

The professor awkwardly picked up his hat and started slowly for the door. His courage was fast oozing away. With one hand on the knob, however, he made a final stand. "Surely, as you are a lady, you will allow me to speak long enough to make an apology." She did not answer, but stood waiting uneasily, Then the botanist made a profuse and humble apology and implored her forgiveness. "I could not help being interested in your hat," he concluded.

"Interested in my hat?" repeated Miss Tool. She looked down at the floor modestly. "I trimmed that hat myself, and I thought it was very pretty. But nobody ever took any notice of it before. I began to think it was a failure."

Prof. Boop cunningly saw his opportunity. To the best of his ability he praised that hat. He remained to discuss botany.

The good professor came again, and yet again to see Miss Tool's collection of plants. And one day he ventured to invite her to see his own gardens. Miss Tool hesitated a long time before accepting an invitation to visit a bachelor's house. But in the end, of course, she went. All one afternoon they examined Professor Boop's flowers.

"Miss Tool," he said, holding out a small red flower, as they rested after their walk. "That is as nearly like the one you had in your hat as I can find."

"How strange you should have thought of that," she returned. "Well," she added, "it is inconsistent of you to have it here if it reminds you of anything like a woman's hat. It's the only thing about here that could remind you of a woman. It is just the opposite of my house. But I think we are both very contented with our own things."

"That's so," said Mr. Boop, reflectively. "But still, since my sister left me, a year ago, to be married, I haven't been very successful at keeping house."

"I can see that," rejoined Miss Tool. "Why don't you get a housekeeper?"

He looked at her thoughtfully through his glasses. "It occurs to me, now that you speak of it, that I ought to have somebody. Perhaps you might like to come and stay yourself. It strikes me we should be congenial."

"Me to go out as anybody's housekeeper?" asked Miss Virginia, haughtily.

"No, no," replied the botanist. "I never thought before of being married myself; but I might stand it. Will you come and marry me?"

Miss Tool grew redder than the flower which he held in his hand. She arose in agitation. "Sir," she demanded, "how dare you talk to me in such a fashion. I must be going at once."

But she did not go home. She went only to the door and then stopped on pretence of examining another flower. Mr. Boop kept his seat, quietly considering the question of matrimony in his own mind. At length he said, in a calm, satisfied tone: "I've a mind to try it anyway. Do you say we shall try, Miss Tool?"

"Well," she answered, burying her face in the flowers and turning her back to hide her blushes. "I am too unprepared to have any views on such a subject, you know. But it is evident that you should have some one to look after you at once. I might be able to sacrifice a little, if there is nobody else who would take care of you."—Illustrated World Life.

The Personal Neatness Club

The former neatness notes have all pertained to the women. The men have a chance this week. Or rather the women have a hint as to how to tidy up the men. As a matter of fact the women should not have to attend to the men, but some way they drop into that habit then it has to be continued. The last thing a woman wants around the house is an untidy man. Like a dog with fleas, he makes you feel kind o' creepy. So a little personal attention has to be given to him now and then. A. M. H. comes with the following on

Care of Men's Clothing.

The cleaning of a dust-laden coat reduces the average woman to despair, but men's suits can be renovated so thoroughly and well as to save buying a new one, as the garments often become faded and soiled long before they are badly worn. It is a good plan to keep a package of absorbent cotton in a convenient place in the dining room, as a bit of cotton instantly applied will remove oil, milk or cream before it has time to leave a stain on the fabric. Honey, molasses or sticky substance may be removed by rubbing with slightly diluted alcohol, and there is nothing better for removing grease spots from wollen fabrics than alcohol and salt. A coat, vest or pair of pants that are not much soiled will come out of a good gasoline bath looking almost like new, but the only safe place to use it is out of doors. First shake and brush the garment until it seems perfectly free of dust, then remove the spots and put the garment in a large pan or bucket and pour enough gasoline over it to saturate it thoroughly, then cover closely to keep the fluid from evaporating, and leave it for two hours. A black alpaca coat and a cloth vest and pair of pants that were still good but had become rusty, were first washed clean and then recolored a jet black by dipping the garments in black diamond dye for wool, and they looked as nice as new garments, after they were carefully pressed. It is best to remove the buttons before washing the garments and sew them in place again after the cloth is pressed, and the butonholes will look much better if they are basted together before washing the garment.

If there is a tear that needs mending set the patch neatly, taking care to match the twill or check, and sew it down so as to make it as nearly invisible as possible, then dampen on the right side and press on the wrong. If the pants legs are worn around the edges, rip out the hems and turn them up far enough to conceal the worn portion, run skirt braid on the underneath side and press carefully.—A. M. H.

Now, boys, brush up and if necessary wash up. Don't ask mother or wife to sponge and press a heavy suit. A. M. H. and lots like her are willing to press suits for the men folks, but it's hard work for a woman.

RECIPES.

How to Make Chop Suey.

"Chop suey is really wholesome, not a mysterious dish," says Fannie Merritt Farmer in Woman's Home Companion for September. "Remove the breast meat from an uncooked chicken, and cut in strips one inch long. Put in a stew pan with one tablespoonful of butter, and cook two minutes, stirring constantly. Wash and scrape stalks of celery, and cut in thin slices; there should be three fourths of a cupful. Add to the chicken with one medium-sized onion cut in thin slices and six fresh mushroom caps cut in strips. Cook five minutes and add one cupful of chicken stock, one half teaspoonful of sugar, two teaspoonfuls of Shoyu sauce and one half green pepper, from which the seeds have been removed, cut in small pieces. Bring to the boiling point and add one teaspoonful of corn starch diluted with two tablespoonfuls of cold water. Let simmer for five minutes, and season to taste with salt."

HOMELY HINTS.

To prevent salt in saltcellars from becoming damp and lumpy, when filling them put in ten to twelve pieces of rice, says Woman's Home Companion for September. "This will not come through the holes in the cover of the saltcellars, but will break the lumps of salt and gather the moisture; thus the salt is always dry and fine."

Put Salt in Shoes.

For rheumatism, sprinkle common salt in the bottom of one's shoes. Put in fresh salt every morning.

Turpentine Cures Coughing.

Inhale turpentine as much as possible. At night, saturate a folded handkerchief with turpentine and pin to the pillow. Place another handkerchief under each arm and saturate the comfort in places with the upper sheet between to avoid the turpentine burning the flesh. A flannel cloth greased with turpentine and lard laid on the chest effects an immediate cure.

To Keep Linen Nice.

What can tend to make the dining room more attractive, fresh and neat looking than nicely folded cloths and napkins? A rule always to follow is after ironing your table linens nicely and evenly to place them in a careful manner in your closet, which already you have padded. To make the pads, take two thicknesses of cotton batting, cover with cheese cloth, and sew together around the edges. A little orris root and lavender sprinkled between the cotton will impart a delicious and fragrant odor.

FOR BEAUTY.

Here are a few rules given by the celebrated French dermatologist, M. Felix Chaleux, for a clear, beautiful complexion and perfect health:

Don't drink tea or coffee.
Drink pure water.
Eat grapes, apples, raisins and figs.
Eat salted almonds.
Don't eat animal food.
An egg or two a day, soft boiled, instead of meat.
Eat an orange every day or so.
Walk two or three miles a day.
Bathe the whole body daily in tepid water.
Don't fret; don't worry; be calm and quiet.

VERY APPROPRIATE.

"My hair is falling out," admitted the timid man in a drug store. "Can you recommend something to keep it in?"

"Certainly," replied the obliging clerk. "Get a box."

By practicin' company manners in everyday life yeh will never be caught nappin' when yeh need 'em most.

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Exclusively a Savings Bank whose policy is for ***Conservatism*** and ***Safety,*** the result of ***50 years experience.***
Deposits may be made and withdrawn by mail.

San Francisco Savings Union

Founded June 18, 1862 Northwest Cor. California and Montgomery Sts., San Francisco

Conducts a Savings Bank Business Exclusively

Capital Paid Up, $1,000,000.00. Surplus, $1,183,832.88.
Total Assets, $27,508,850.00.

The
Barker Portable Cottages, Bungalows, Garages, Tent and Poultry Houses

These houses are correctly built of selected material and are so different from the ordinary portable houses as the aim has been to make them look like a permanent structure built on the ground. They have stood the test of years and are conceded by experts to be the best, cheapest and most practicable portable house made. Please investigate before purchasing or building. We also manufacture sanitary poultry houses of our own designs. Write or call at office and factory, corner of Topeka and Alameda Streets, Long Beach car line.

Hay.

Somers & Company appear to bear the market in their circular as follows:

In spite of the fact that the season is growing late and that all hay out of doors is in danger of damage from rain, yet there seems to be quite a bit of hay not housed and we note but little diminution in shipments of hay to market, the total for the week ending today amounting to 3680 tons in comparison with 3880 for last week. The situation remains unchanged in every way with a day of light receipts showing improved figures for the choicer varieties of hay and a day of heavy receipts bring material weakness to the market. Ordinarily we begin to anticipate showers about the middle of September and very frequently we have to begin drawing from the warehouses about the first of October. We anticipate that this will be so this year but as practically all the warehouses are well filled we do not anticipate any shortage on our market, although should anything in this line develop we can draw quite easily from three adjoining states for a considerably supply. The future therefore shoud cause apprehension for no one and as we see it there should be but little advance over the present range of prices during the remainder of the season.

Local business continues rather quite and although many interested parties claim they can see evidences of improvement yet the more conservative ones report that trade is very quiet and although they do not anticipate any improvement for the balance of the year yet they report matters as being in a fairly satisfactory condition. Until trade in general improves we can anticipate but little of interest in connection with the San Francisco hay market.

Citrus Market

LOS ANGELES, Sept. 16, 1908.

The Valencia market stands much as last week—very quiet and all good fruit bringing only fair returns. Shipments continue moderate, with less than 200 cars yet to go.

Lemons are slightly better and at this time receiving fair prices. All fruit is still going forward as cut from tree.

Shipments.

Shipments of citrus fruits since November 1, '07, 28,644 cars of which 4493 were lemons. To same date last season 26,607 of which 3114 were lemons.

NEW YORK, Sept. 15.—One car Valencias and one mixed car sold. There is a better tone to the market. Weather clear, cool.

IRRIGATION IN CALIFORNIA.

Continued from Page 273.

irrigation. The danger always arises from the liability of the soil to become alkaline caused by the constant deposit of salts in solution.

The analysis of the chemical composition of the silts reveals the fact that they contain quartz, feldspar, mica, calcium carbonate, nitrites and nitrates and are exceedingly rich in animal and vegetable matter. The analysis points out very clearly their value as a fertilizing element. In 1902 some observations were made and data gathered with reference to the fertilizing value of silts deposited by the Salt River of Arizona. The estiacre foot of water. The results were as follows: Total sediments deposited 22,660 pounds; phosphoric acid deposited, 17 pounds; value 34 cents. Potash deposited, 44 pounds; value $2.25. Nitrogent deposited, 35 pounds; value $5.42, making a total of $8.01.

The values given to the fertilizing materials were taken from eastern market prices on fertilizers. Thus we are at once convinced of the great value of silts from the fertilizing point of view and should endeavor to irrigate with silt bearing waters when possible.

Onward.

The past quarter century may be looked upon in the history of agriculture in California as one in which great advances have been made. The day of the careless and uneducated tiller of the soil has passed, and we are now entering upon a new and greater agricultural era that shall require a scientific and systematic knowledge. The science of agriculture is just dawning and we are compelled to marvel on what the next quarter century will bring forth. One by one the problems that confront us are solved. The great problem confronting agriculturists in the past has been the transforming of semi-arid lands into fertile fields. Irrigation has solved that problem, and the great possibilities for opening up vast and infertile regions cannot help but attract the eyes of the world to our golden State, and cause California to enter into a new and unparalleled commercial era.

SECOND HAND PIPE

We will sell you pipe that can be used for any purpose. **Satisfaction guaranteed** or money returned. We handle all sizes of standard pipe and casing. Shipments made on same day as order is received. Price of pipe is low now. Write for our prices.

RULES AT A SUMMER HOTEL.

1.—Plug hats, also white derbys, shot 15 minutes after arrival.

2.—Penalty for wearing boiled shirts on Sundays is cigars for the crowd; on week days, $2.50 for first offense; $5 for each offense thereafter.

3.—More than one shoe shine per day, or one suit of clothes per day, is punishable by a fine of not less than 25 cents or more than $3.25 for each offense.

4.—Telling a lie, fishing on Sunday, or indulging in games on Sunday is deemed bad taste.

5.—The proprietor shall be fined cigars for all if meal time vary fifteen minutes from regular time.

6.—Dudes are ducked in 50 feet of cold water in the lake.

SUGAR CURED MEAT.

Butcher in the coolest weather and after scalding and cleaning, the animal should be hung up to cool over night. Cut the meat up and shape it nicely. Salt very lightly, to bring out the blood and allow the salt to remain a day or two. Prepare a brine, using ten pounds of salt, two ounces saltpeter, two pounds brown sugar, one ounce red pepper, and five gallons of water for each one hundred pounds of meat. Let this brine, which will be strong enough to float a fresh egg, stand until the ingredients have dissolved, then place the hams in a tight barrel, rind side down, then the shoulders, and then sides, and pour the brine over them until they are covered. After 110 days pour this brine off and cover with fresh brine prepared as the first was. When they have been in the brine a month take them out, wipe with a cloth, and while still damp sprinkle powdered borax over the flesh side, using a tablespoonful to 15 pounds of meat. A large pepper box is a great help in applying the borax. Hang the meat up and smoke for two or three weeks. The smoke must be cool before striking the meat. This can be done by running a tile under the ground 10 or 12 feet and allowing the smoke to pass through this tile before coming in contact with the meat. If a high smoke house is used the tile won't be needed. When the meat is smoked slip each ham into a flour sack and hang in a cool, dry place until you wish to use them.

The first purchases of hops at Portland were at 6½ cents per pound.

Character, is what we are; reputation is what people think we are. We are daily building our characters. Every act is a stone in the building. We should be careful to have good material. There is much that is wood. hay and stubble. The four elements that enter into character building—thoughts, companions, reading and aim in life. Be careful of your thoughts. company, books, motives. These make enduring character. Reputation will take care of itself.

HOW TO GET RID OF ANTS.

Black and brown ants may be gotten rid of by sprinkling the shelves with borax. The borax may have to be renewed for several days for the ant is a persistent enemy and will not give up his home until literally forced to do so. Red ants are proof against borax, but a few drops of cinnamon oil will usually drive them to new haunts.

DOES SOMETIMES.

Youthful Customer (at bookstore)—What does "Bridge Whist For Beginners" cost?

Somber Salesman—It will probably cost you your entire wad.—Pick-Me-Up.

HE WANTED TO KNOW.

Mr. Calipers (didactically)—Hunger, my son, is the best.

Little Clarence—Yes, sir. But how do they spread it on anything?—Puck.

AS TO A FRIEND.

"How about him? Is he straight?"

"Yes he's straight, but he dosen't bend over backward."—St. Paul Pioneer Press.

The editor of an agricultural paper was grumbling about a puzzling question he had received from a city man who had recently removed to the country. The inquiry was this: "Will you kindly tell me how long cows should be milked,"

The office boy, passing near, heard his superior repeating the question aloud.

"Skuse me boss," he said; "but w'y don't yer tell him jes' de same 's short cows?—"Judge."

Small Grace viewed the new baby with open scorn and indignation. "Why, mamma, you surely won't keep it? You know you always exchange damaged goods, and this one has no teeth, no hair, and its skin doesn't fit at all!"—Lippincott's.

Mrs. Henpeck—They say that women do all the talking, but I notice in a wedding ceremony the man has as much to say as the woman. Mr. Henpeck—Yes, but it usually stops right there.—Brooklyn Eagle.

"Now, tell me why I punished you."

"That's it," sobbed Johnny; "you nearly pound the life out of me, and now you don't even know why you did it."

A neat little booklet entitled "Wholesale Price List Placer Nurseries," has just been issued by the Silva-Bergtholdt Company of Newcastle, Cal. This enterprising company is building up a magnificent business by its offerings of high grade stock. All kinds deciduous fruits, grapes, berries and citrus fruits are offered.

The Riches of San Joaquin County

FROM the fact that these garden spots of San Joaquin county are principally islands surrounded by natural or artificial streams, it is made imperative that their product be moved by water craft of great or small tonnage; hence the number and variety of the vessels seen upon the waters of the San Joaquin.

During the entire year this river is navigable above Stockton for a distance of forty miles, and it taps one of the most abundantly productive districts in the State of California. Below Stockton, and immediately adjacent to it, the San Joaquin and its most important tributaries, the Mokelumne and Old and Middle rivers, traverse the greatest delta and reclaimed land area known to the agricultural world. This consists almost entirely of islands reclaimed from the bottom lands and comprises hundreds of thousands of fertile acres yielding generous crops of barley, potatoes, asparagus, garden truck and fruit, as well as furnishing rich grasses for the support of the extensive dairies here found.

IN the United States are 2744 counties, all of which figure to some extent in the returns of agriculture. This is, more distinctively than any other region of the Earth's surface, an agricultural country; and wherever in the United States agriculture is most intensive and varied, there will be found thrift the most general and prosperity the most uniform and continuous. The only universally recognized authority on the products of agriculture in the United States is the Federal Census. The most recent report of the Census Bureau on the statistics of agriculture was the report of 1900 for the crop of 1899. Therefore to ascertain the comparative standing in agriculture of any county of the United States, it is only necessary to examine the reports of the Census Bureau for 1900 and note the outputs of the various counties.

In the production of barley the ten leading counties were all in the states of California, Wisconsin, and Minnesota. San Joaquin county ranks first in acreage and output, according to the census, yielding 3,467,520 bushels.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Winter Onions in the Southwest

An Article Written for Arizona and South Eastern California Conditions
By E. L. CRANE and R. H. FORBES of the University of Arizona

ONIONS are very successfully grown as a winter crop in our warmer Southwestern valleys. Planted at the close of hot weather, the crop grows during the cool months when labor is most effective, and early varieties mature in time for high prices in mining and coast towns.

The Soil.

While onions may be grown successfully on various types of soil ranging from a sandy loam to a heavy adobe, the lighter loams are preferable because of less cost in preparing the ground. Onions require a fertile soil and are especially favored by an abundance of organic matter which may be cheaply added in the form of well rotted barnyard manure. Onions will not endure much alkali in the soil, especially if ridge culture is followed, which favors a surface accumulation of soluble salts around the plants.

Arrangement of the Ground.

Onions are grown either in flat culture by flooding, or on ridges by furrow irrigation. The flooding method is more applicable to heavy soils, which work easily and sub-irrigate readily.

For ridge and furrow culture the field should be perfectly level and laid off for rows from 100 to 500 feet long. This arrangement will permit of equal and sufficient irrigation without loss of water or flooding the rows. Having previously plowed under a heavy application of well rotted barnyard manure, or a green manuring crop with subsequent irrigations, the ground is again irrigated just before planting time. When sufficiently dry it is disk and drag harrowed to secure perfect surface pulverization. To make the ridges, begin at one side of the field and with a six-inch turning plow throw a shallow furrow towards the right. Returning to the same furrow throw an equal amount of soil in the opposite direction. At a distance of 30 inches between furrow centers repeat the operation, thus throwing soil slices together in pairs to form the ridges in the rough. These may be conveniently finished by dragging them lengthwise with a long weighted plank drawn by a horse. This will leave flat-topped ridges about 24 inches wide on top, with furrows about six inches wide and deep between. Thus prepared the soil may be more easily kept in tilth and weeds controlled, than in flat culture.

Methods of Planting.

Onions may be grown from sets, from seed sown in the field, or by transplanting young onions from seed beds to the field. Although onions grown from sets may be matured about two weeks sooner than from seed there is a large percentage of multipliers among bulbs so grown. Also many blossom stalks are sent up, requiring much labor to remove and seriously damaging the selling and keeping qualities of the crop. To the plan of sowing seed in the field there are several objections. Being somewhat difficult to germinate the seed must be carefully sown in perfectly prepared soil. This entails much more expense in a large field than for seed beds only. Again, between planting time in September and the first frosts, several weeks of weedy weather intervene, necessitating several expensive cultivations. Also, the labor of thinning and replanting missed spaces, is greater than for transplanting; and the cost of seed is more.

The best and cheapest method is to sow the seed in beds and transplant later in the field. As soon as hot weather abates, (usually in September) the seed is thickly sown in drills five inches apart in beds of well fertilized soil. The water furrows must be placed at intervals suitable for sub-irrigation. Two pounds of seed thus planted will provide young onions enough for an acre. If the soil is moist when the seed is planted, the seedlings should begin to appear in about nine days. An irrigation will then bring the whole stand up quickly, and with proper irrigation and cultivation thereafter the young onions will be as large as slate pencils in nine or ten weeks and ready to transplant, usually in December.

The ridges having been prepared just in advance of planting, the young onions are lifted, as needed, the roots trimmed to an inch in length and the tops cut back about half. The rows are best laid out along the ridges by means of Crane's marker. This is a round cottonwood log two feet long and ten to twelve inches in diameter, with three rows nine inches apart of pegs extending around the roller. The pegs should be about 1½ inches long and spaced at four to six inches, according to distance desired between onions. By means of a light frame tacked to the end of the roller, the marker is drawn along the ridge, leaving three perfectly uniform rows of holes. The trimmed plants are then dropped one at each hole, set about 1½ inches deep and the soil firmly pressed about them by hand. It is then well to irrigate them lightly to insure an even start of all the plants. By this plan about 120,000 onions an acre may be placed, planting five inches apart in the row, with three rows to each ridge.

Irrigation and Cultivation.

If the ground has been well prepared and ridges and furrows carefully constructed, the labor of irrigating and cultivating onions is not excessive. For the sandy loam of the Yuma trial ground about 15 irrigations are required from September to April in seed beds and field. Irrigation should be followed by cultivation both in furrows and on ridges, to kill weeds, lessen evaporation of soil moisture, and break up the salty crust which in most arid soils tends to form on inter-irrigated ridges. The Planet, Jr., No. 4 wheel hoe and cultivator is an effective tool for onion culture.

Insect Pests and Diseases.

Grasshoppers have occasionally damaged young onions in the fall before frost; but the onion thrips is the most serious insect pest thus far encountered. This minute creature developed in great numbers in Yuma onion fields in the spring of 1908. Strong kerosene emulsion is the best treatment tried.

The downy mildew, peronospora schleideni, which does much damage both in the Atlantic states and California, also appeared, doing much damage. Bordeaux mixture, applied with a spraying apparatus, is the proper treatment for this fungus.

Varieties.

In order to reach the early markets in April and May, it is essential, planting seed in September, to use the earliest varieties of onions, inasmuch as they require between seven and eight months, including the winter season, to mature. At Yuma the White Bermuda is the most successful variety thus far proven, although the Red Bermuda and the Crystal White Wax are close competitors. These are all mild, early onions and good producers, but must be sold promptly as they do not keep long. The superior appearance of the Crystal White Wax brings it a somewhat higher price than the Bermudas, compared with which, however, this variety is a little later and a poorer keeper. New White Queen produced a good test crop of large late onions in 1906. The El Paso and the Prizetaker are very uncertain yielders under Colorado Valley conditions; while Louisiana Creole and Australian Brown have thus far produced tops only, and no onions. At higher elevations, however, near Tucson and Graham county, Australian Brown is a good producer and keeper.

Onion seed must be fresh and should be secured from reliable dealers.

Harvesting and Marketing.

As the onions attain marketable size, maturity may be hastened by withholding irrigating water and drying out the soil. To the same end also the tops may be broken over by means of a small roller. By these means three weeks may be gained in time of ripening. The lessened yield will usually be more than made up by higher prices for an earlier crop.

Next to transplanting and cultivation, harvesting is the most costly item in connection with the crop. Flat culture onions are most costly to harvest, requiring the aid of a digging tool, especially in adobe soil. Ridge culture onions, however, if the soil is light and has been kept mellow by cultivation, may be pulled by hand, and tops and roots trimmed with a sharp knife in one operation. The trimmed onions are collected in small piles, covered lightly with grass or weeds to prevent sunburn and left a few days to cure. If to be kept for some time they must then be stored in thin layers or crates in a cool, shaded, well ventilated place.

Sacks are a cheap market package, costing 5 to 10 cents for 105 pounds; but sacks allow the onions to bruise. Fifty pound onion crates, costing 14 to 25 cents each in Arizona, are more convenient to handle, insure better keeping, and are usually demanded by the trade.

Costs, Yields and Profits.

The cost per acre, in money, of growing onions must vary widely according to local conditions and personal management. At the Yuma garden, with a sandy loam soil, by the method of transplanting to ridges, an acre of White Bermuda onions, delivered in Yuma, requires about eighty days' labor by men and boys, and five to ten days' team work, worth in wages about $170.

The yield of White Bermudas at the Yuma garden in 1906 was 8330 pounds per acre. In 1907 on the same ground, 20,000 pounds per acre. Eight tons per acre is a common yield in the region, this figure being sometimes exceeded in the onion district of south Texas.

The profits depend not only on skill in growing and yield, but also upon prices and marketing facilities. In 1907, with a good yield and prices ranging from two to five cents a pound delivered at Yuma, 1.2 acres of White Bermudas netted about $400 after deducting all costs, including labor. In 1908, with increased costs and decreased yields due to onion thrips and mildew, with a late season, demoralized markets and poor shipping arrangements, the crop was grown at a loss.

With a considerable early market demand in California and Arizona towns and with an efficient shipping organization, early onions may still be considered a fair chance as a winter crop for the Southern Arizona grower.

THE CANTON CLIPPER

Has been on the market **since 1842—two-thirds** of a **century,** and is made in the largest and oldest permanently established plow factory in the world. It is

The Perfect Plow

WHY?

Has a high beam, giving good clearance at the throat. The beam and handles are long, giving a powerful leverage. The handles and beam are thoroughly and strongly braced, and the plow will withstand any strain. The **bottoms** are **mechanically perfect** in shape, material and finish, and have the high polish and scouring qualities which have made the **P. & O. Canton Clipper** the **leader** of **all plows** in all sections.

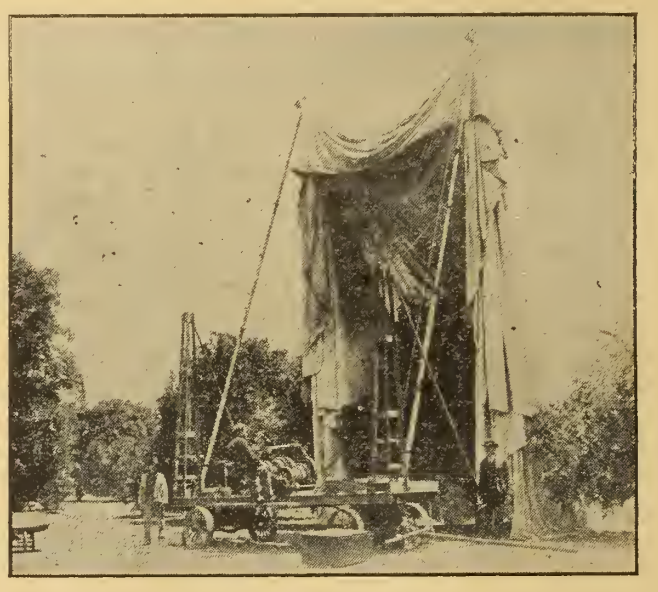
With the Citrus Growers

TENTS OVER BIG TREES.

THE process of fumigation of small citrus trees has been very satisfactory and economical in handling. But the placing of tents over big trees has been so difficult and slow as to make the proportionate cost much greater. Several methods of throwing the tents with poles and with small derricks have been devised but all are more or less cumbersome.

We recently learned of a plan now being followed by McFadden Brothers of Fullerton and from Mr. C. E. McFadden we have received the item from which the following was made up:

The machine in question has several points of advantage over the old method of handling tents. First of all it does away with the hard work of handling large tents, no matter what the size. They are taken from one tree and placed on another with perfect ease in exact position, thereby reducing the pushing and hauling of



The McFadden Tent Hoist.

tents into position after they are once placed. Second, it saves the trees, as the tent is lifted bodily off from the tree and placed over the other in such a way as to cause the least possible "drag" over the top of the tree. This dragging of the tent off from the tree has been the cause of more breakage of limbs and loss of the fruit than any other part of the work. This method also saves the tents as the gentle lifting does less tearing than the pulling over the tops of the trees. Lastly, by using the new system of sizing trees and generating, by using six men, a string of from 30 to 50 tents can be shifted so as to cover fifty to seventy-five trees an hour. This is from three to five times the number that can be handled the old way by the same number of men.

Mr. McFadden writes that he is operating a machine in the Placentia district and that one minute is sufficient to throw the tents. The tents are 55 to 65 feet. The photograph given on this page will give a very correct idea of the work by which the two masts are operated by a little gasoline engine on the truck.

At the recent annual meeting of the Indian Hill Citrus Association held at North Pomoua the followiug officers and directors were elected for the coming year: C. B. Sumner, president; E. C. Robinson, vice-president; A. T. Currier, treasurer; V. W. Baker, W. A. Fox, C. E. Straight, D. C. Crookshank, W. H. Schuremau, secretary and manager.

CITRUS FRUIT GROWING IN SOUTHERN CALIFORNIA.

FARMERS' Bulletin No. 238 treats of this subject in a concise form and sums up the situation as follows: "The growing of citrus fruits is a horticultural accomplishment not surpassed in any line of the art. There are very few agricultural occupations that require an equal amount of judgment and very few that give as remunerative a return for the mental outlay. Everyone who is willing to pay the price either in labor or in dollars, can grow orange and grape fruit, but only he who is so constituted as to derive pleasure in exercising his mental faculties to their fullest extent can produce fruit of the first quality. There is a very long series of conditions from the choice of the stock with which the bud is to be placed, to the delivery of the package of perfect fruit to the consumer, which must be met successfully. If any of these links in the chain is broken, first place cannot be obtained. Good judgment with previous knowledge must be exercised in the choice of stock, the bud, the soil and the location of the orchard, in the cultivation of and the fertilization of the crop, in the treatment of fungous and insect disease, in picking and packing the fruit, and in selecting a market for its disposal.

"The production of the finest oranges requires years of most careful study and as diligent attention as the most intricate business operation. Unless the citrus grower is in full sympathy with his work, he will as surely fail to produce the best results as would be in the case of any other occupation."

The above remarks do most certainly apply to California, as they deal with men and methods, but in the discussion of the climatic conditions that govern citrus culture in the Gulf regions, the discussion does not apply to California at all. It is stated that in the Gulf regions, places where the temperature does not fall below 18 deg. above zero nor rise above 100 deg., and where there is sufficient moisture, citrus fruits may be raised, intimating that the best fruit is not always raised where those limits are reached, though as a rule, such limitations mark the locations in which it is considered safe to grow citrus fruits. In that region it is considered impossible to grow oranges if the rainy season comes during the time the oranges are maturing, as it interferes with gathering and marketing. We do not consider the rainy season at all in California, in fact it is quite common to hear growers express a desire to have it rain during the height of the picking season so that the market may have a chance to clear, by stopping the rush of fruit to the mar

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.

This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

ket. In fact, this is quite an important item some seasons. The great bulk of the California orange crop is harvested during the rainy season, and very often the market is strengthened by a rainy period.

The bulletin states the more nearly the northern limit the fruit is grown, the more sprightly and deliciously flavored it is, some of the best being grown where the trees are in danger of being frozen. An ideal climate is described as one where the rainfall occurs after the fruit is picked and before the new crop begins to ripen, and where there is not a continued cold of less than 26 to 27 deg., and preferably not above 100 deg.

There is but one condition here that is desirable for the California growers and that is the 26 to 27 degrees. Our rainy season is just the opposite to the one described as desirable and nothing so delights the grower as to have a temperature of 110 to 112 deg. for a few days in July or August. It reduces the black scale to a minimum and dispenses with fumigating for that part of the season at least.

A temperature of 26 or 27 degrees will not seriously affect the trees in this state during the time from November to the middle of February, though it will surely injure the fruit. We do not know what would happen should such a temperature occur during our spring growing season. We know, however, that freezes that will kill almonds (the nuts) which are nearly full grown, will not affect the blossoms of orange trees, showing that the orange has a remarkable resistance to cold in our climate.

When Florida was in her prime as an orange growing state, certain natural features preserved her climate that was favorable to orange growing. The orange groves were among the pine forests and as the profits in orange growing showed a growing tendency, these forests were cut down and orange groves planted. The tempering agency of the climate was removed, the orange groves were frozen dead and the Florida citrus belt was compelled to move further south and occupy a much reduced area.

In Southern California we again find the conditions reversed. What was once a barren and desolate waste from the San Bernardino mountains to the sea, for instance, is now dotted and streaked with groves and rows of Eucalyptus trees which exert a modifying influence on both the winter and summer climate. It has been recognized for several years by some growers that a liberal planting of Eucalyptus trees around the groves prevents severe freezing. There are groves in Cucamonga, divided into blocks of a few acres, where it is found that dangerous temperatures are unknown where they used to be quite common. Other instances are common and it is a fact the extremely low temperatures that occasionally visited Southern California have not occurred in recent years, and as the craze to plant Eucalyptus has spread all over the south, there is reason to believe that the dangerous winter temperature will in time be of the past in fact.

These points were brought out by Dr. Pearson at Claremont one time and in the course of his address he said that the time is not far distant when the country from Redlands to the sea will be the "Paradise of the Earth."

This, coming from a man of his standing and wide travel is certainly reassuring to the orange grower of Southern California.—J. W. Mills, Marysville.

Pickling Olives

FOR home processing of olives, the following written for a department bulletin by W. W. Skinner of Arizona, is good.

The olives, either green or ripe, should be packed into pails about one-third full of water, to prevent bruising, and sorted as to size and ripeness. The fruit is then placed in suitable vessels (preferably stone jars, though wooden kegs, etc., may be used if sterilized so that they are free from mold spores), the water poured off, and the fruit covered with a solution made of 2 ounces of soda lye, 1 ounce of lime, and one ounce of common salt to a gallon of water. The solution should be thoroughly mixed and allowed to stand an hour before using, and is best if made of boiled and cooled water. It should stand about 2 inches above the fruit and if any of the olives float it is necessary to cover them with a board and weight.

The time of the lye treatment varies from three to seven days, according to the variety, size and ripeness of fruit. The solution should be examined daily, and should the sleek, soapy feeling peculiar to lye disappear, it indicates that the solution is exhausted. The old solution should therefore be poured off and new solution added. It should be changed at once should any scum or mold appear. The fruit should be frequently examined, always sampling the largest olives by cutting away a portion with a sharp knife. The progress of the lye toward the interior of the fruit is plainly marked by a distinct dark ring. When the ring has reached almost, but not quite to the pit, it is time to remove the lye and commence the washing.

The lye should now be poured off and water added and renewed morning and night. The wash water should also be boiled as a preventive of mold, which is very likely to develop at this stage of the pickling process. The fruit should be kept in water, as before, with the board and weight, and throughout the extraction, washing and salting, the vessel should be closely covered. It will require from four to seven days to remove all traces of the alkali. Washing should be continued as long as the fruit has the peculiar hot taste due to the presence of lye, and it is well to test it with red litmus paper, which will turn blue if a trace of the lye remains. If the olives are still bitter after the washing has been completed, they should receive a second treatment with lye, followed by washing.

When free from lye, the olives are ready for salting, the brine being composed of 2 ounces of common salt to a gallon of water. It should be thoroughly boiled, cooled and poured over the olives. The next day this solution should be poured off and a solution containing 4 ounces of salt should be used. "If the stronger solution is used to begin with, the olives will shrivel. The fruit should next be treated with an 8-ounce brine, and if intended to keep for some time, finally with a brine containing 14 ounces to the gallon. A 14-ounce brine, however, makes the olives too salty to be used without a slight soaking."

In the author's opinion, a better method of keeping the finished product is to process the olives after adding the 8-ounce brine. Glass fruit jars filled with olives and brine, with the covers lightly screwed down over the rubbers, are stood in water in a tin wash boiler and heated to 175 deg. F. for thirty minutes. They should be then removed and the covers quickly tightened. By this process the flavor of the olive is not injured, and if properly done the fruit will keep at least several months without deteriorating.

REVISE CITRUS TARIFF UPWARD.

The citrus growers are moving early and vigorously for the tariff revision, and are adopting as their slogan "Revise Upward." At the Eighth District Republican convention recently the plank on revision contained:

"We urge upon our representative the importance and justice of the present moderate tariff on citrus fruits and other agricultural products of this district. Any revision that may be considered with reference to these schedules should be upward, rather than downward. We endorse the movement among the citrus fruit growers of the state to secure an advance in the tariff on lemons, and pledge our congressman to use his best efforts to maintain the protection the fruit growers now enjoy and to secure such increase as may be equitable and just."

Do Irrigation Work---Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blueher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

Contents

RICHES OF SAN JOAQUIN COUNTY. Cover.

WINTER ONIONS.—291.

CITRUS.—Tents Over Big Trees; Citrus Fruit Growers in Southern California; Picking Olives; Revise Upward, 292, 293.

EDITORIAL.—Rose form the Farm; Place your Nursery Orders; Fresh Eggs; Better Fruits Served to Tourists; Grow Trees; Co-operate; Some Apples at Watsonville, 294.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern the Coast, 294.

DECIDUOUS.—Charges Against our Fruit; Gummosis of Cherry; Picking Pears, 296.

DAIRY AND LIVE STOCK.—Grain Feeding on Pasture; The Dairy in Hot Weather; Sand-cracks; Importance of Live Stock Industry, 297, 298, 299.

MARKETING PRODUCE.—300, 301.

POULTRY.—Controlling the Molt; Brevities; Ventilation, Pigeons; Importance of Strain; Dust Bath; Crop Dropsy; Patience, 302, 303.

SMALL FRUITS AND VEGETABLES.—Time and Wor-- savers; Strowberries; Celery Plants Going to Seed, 304.

ORNAMENTAL GARDEN.—How Trees are Made Symetrical; The Calladium, 305.

QUERIES AND REPLIES.—Grape Juice; Dried Fruit Wanted; Grafting Pecans; Washington Grapes; Fungous Diseases; Plums; Drying of Figs; Bottle-Neck Melons; Dry Pasture; English Walnuts; Freak Chrysanthemuns; Horticultural Commission; Curing Olives; Bleaching Walnuts; Cracked Hoof; Budded Loquats; Gumming of Orange Trees; Alfalfa Grinder; Ticks; Harvesting Beans; Douglass' Mixture; Itch or Lice; Various Questions; Chicken Fleas, 306 307.

HOUSEHOLD.—Make Good; Br'er Rabbit at Uncle Remus'; Recipes; Curing the Borrowing Habit; A Goat for The Baby, 308, 309.

PRODUCE MARKETS.— Los Angeles Market; San Francisco Market; Citrus Markets, 310, 311.

ROSE FROM THE FARM.

In the biographies of many of our great men it is chronicled of them that it was their good fortune to be born upon the farm. More recently the turn has been made of this phrase "rose from the farm" until it has become rather threadbare and in fact is used to convey the impression that notwithstanding the great incubus of being born upon the farm and amidst rural surroundings the great man in question has risen to his present dizzy height.

The country boy who was perhaps too dull to know which end up to plant a tree, migrates to the small town, gets himself appointed as dog catcher and at once proclaims that he has achieved his present position, notwithstanding "he rose from the farm."

An exchange in speaking of this customary method of expression says:

"Would that some one with a little insight would issue a volume entitled, 'Fallen from the farm.' including the lives of a few representative corporation lawyers, trust magnates, predatory preachers, defaulting bank presidents, special interest senators, and hireling judges. We are not certain but that a president or two could be used as a climax for the concluding chapters."

PLACE YOUR NURSERY ORDERS.

The young trees planted last spring have not yet ceased their summer's growth, but they are near enough to it that it may be wise to consider the coming season's planting. Many orchardists will have occasion for filling in where others died; more will probably extend their orchard planting. It is none too soon to cast about and determine what that planting shall be, also where the trees shall be secured for the planting. There are but few growers who will ever look this far ahead. But many have been disappointed in rushing to the nurserymen for trees desired at the last moment only to find the selection culled over until the required "sorts" may not be secured. An order placed at this time or within the next few weeks with any reputable nurseryman will insure delivery of the best of trees and at a price probably as reasonable as may be secured later.

FRESH EGGS.

In the main the National Pure Food Law has been in the interests of the producing class of the country. Occasionally a ruling is made which seems unjust and very detrimental to the best interest of the farming class. A recent ruling which we believe is not only just but will be to the best interests of the poultry industry declares that fresh eggs are fresh eggs. In other words, any one attempting to market cold storage or processed eggs as "fresh ranch" will be up against the Department of Agriculture and a possible heavy fine. The Cultivator is aware that this method of disposing of cold storage eggs is not only sometimes done but has been a too common practice. Nor is this entirely laid at the door of the commission man or large egg dealer. The writer of this was once told by an egg producer of this state that during April, May and June all his surplus eggs were placed in cold storage. Later in the season when prices were doubled or more he would take his load of fresh eggs to town, dispose of them and returning with a case or more from cold storage warehouse would "candle out" the finest stock and take them back the next day mixed with his freshly gathered eggs and sell all as "strictly fresh." This was told in an off-hand way as if it were a legitimate practice. Hence for the benefit of such the Cultivator now calls attention to the fact that such practice is not countenanced under the National Pure Food Act.

BETTER FRUITS SERVED TO TOURISTS.

The fight which was inaugurated by the California Promotion Committee and is being continued by fruit growers up and down the State to induce hotels and restaurants of the Pacific Coast to serve a better grade of fruits on their tables is attracting much attention and will, we believe, lead to satisfactory results. Editor E. F. Adams in the San Francisco Chronicle suggests that instead of making a high grade of California fruits as high priced as most of the better class hotels do, they should make them according to the department store plan, a "leader."

It is notorious that the better grade of fruits has been sold to canners or to shippers of fresh fruits, while we have brought to our own markets lower grade fruit which will be refused or will not carry by eastern markets. This has placed the lie upon our own claims of being the producers of the finest fruits in the world. We are glad the hotel men are receiving the suggestion in the spirit which they are, although at first they came back with the claim they were unable to secure first class fruit in the open market.

Let our producers correct this condition and see that our best markets are supplied with our best fruit.

GROW TREES.

Some have complained of the fact that California farmers are impulsive. That is, when one plants orange trees, everybody wants to plant orange trees. When the style is peaches, peaches go with anybody. This season, owing to the prolonged campaign of education for forest trees, there will be extensive plantings of eucalyptus trees. There is but little danger that this will be overdone, fortunately; on the other hand, it will be entered into by many growers who have an insufficient understanding of the problems before them. Such may be disappointed because exaggerated claims of profits have been made.

Too many have an idea that eucalyptus is a synonym for such a vigorous life that the tree will grow and flourish remarkably with no care on almost any kind of soil. Truly remarkable results have been obtained in many sections with many kinds of eucalyptus trees. But let not the prospective planter be led astray by claims of wonderful worth for many of the untried varieties.

There are 150 or more varieties of this wonderful family, some of which are in this State practically worthless. For instance, the Jarrah has been often referred to as producing in Australia some of the most serviceable timber grown in that country. That far the claim is true, but in California we have yet to hear of a single tree which has lived in the open, unprotected for more than two or three years. The common blue gum or Eucalyptus globulus, stands today as one that has been absolutely proven and made good in California conditions, and only in the last few months has the wonderful worth of this wood been proven. Others may be shown to have as great worth in Australia, but let not the planters proceed to put out acres of them until the test has been made under California conditions.

CO-OPERATE.

Like the preacher who can always get the right doctrine from any text he may take from the Bible, the Cultivator is always able to get the lesson of co-operation out of any problem which may confront the farmer. The plan of co-operation is almost essential in the marketing of our fruits, in fighting our pests, in gathering together the fund of information necessary to conduct intelligent farming. Regarding the marketing of our products we have spoken in season and out of season. Occasionally also we have referred to the advisability of co-operation so as to secure tents, spray pumps, or other appliances to combat our enemies. More economical and more effective work is possible thereby. A correspondent in this paper some weeks ago suggested the advisability of passing a law compelling the killing of ground squirrels on a certain day. This may be, probably is, impracticable, but certainly the united action of a whole neighborhood going to work on a certain day or certain week would have a much more beneficial effect than the way it is usually done. We believe it has been tried in Monterey county and would be glad to hear from those who have tried it there.

In any case, let us co-operate, let it be in marketing our fruit, killing our pests, or along any line in which we may strengthen each other's hands.

SOME APPLES AT WATSONVILLE.

We have ever championed the apple in California, for we believe that in time, as her apple sections become known and developed, she will stand at the head of the apple-growing States of the Union. This year the Pajaro Valley alone will ship 4000 carloads, and these are now going forward at the rate of 25 to 30 cars daily. From all the apple sections reports reach us that the crop this year has been a fair to good one, although the fruit as a rule is somewhat undersized. Prices being received from the shippers are fair and satisfactory to the growers.

Shop Talk

DRY FARMING.

We are receiving orders daily for Campbell's "Dry Farming Manual." This nicely bound $2.50 book, devoted exclusively to dry farming methods, has been lately reviewed and commented on by the **Cultivator.** Every rancher is interested in the subject and should have the book; especially at the terms offered by us in this and previous issues.

For either a paid new subscription, or a renewal, to the **Cultivator,** with $1.50 in cash additional, we are sending the book prepaid. Or, for $5.00 for five new subscribers at $1.00 each we will send the book **free of charge.** Note that in this latter case renewals do not count. For admirers of the **Cultivator** this will be an attractive way of obtaining the book. Especially in sections where there are many new arrivals there will be no difficulty in getting these few new names.

Agricultural Notes of the Pacific Coast

Northern California

Bartlett pear harvest of the Sacramento valley is about over.

Several Ukiah hop growers have sold their crops at 7 cents.

The Meridian Creamery in Sutter county has been sold to Mr. C. F. Summy.

Butter output of the Sacramento valley will be greater this year than ever before.

The State Dairy Bureau has a very active force enforcing the State laws bearing upon creameries and dairies.

Gold Ridge, Sonoma county, is attracting attention this year for the remarkably fine quality of its apple shipments.

Hop growers of Sonoma county have found trouble in finding sufficient help at the price of 80 cents per hundred for picking.

The Oroville Chamber of Commerce is perfecting arrangements for its citrus fair to be held November 30th to December 5th.

Rains which visited many sections of Sacramento valley were sufficient to lay the dust but did no serious damage to hay or fruit crops.

Owing to the low price of wool Tehama county sheep men will not shear sheep this fall, but will allow sheep to carry over till spring clip.

The Vacaville Reporter says that some of the better cherry orchards of Solano county will bring a profit to their owners this year of $300 to $500

The contract for restoring the Tisdale Weir near Colusa has been let to the Western Bridge and Construction Company for nearly $11000.

The hop picking season at Wheatland has ended, and the first season's operation of the Horst hop picking machines has been very satisfactory.

Steps are being taken to secure a large irrigation system for lands near Corning, Tehama county, the water to be secured from Coast Range Creek.

Owing to shortage of spring rains the season's beet crop in many sections of Sacramento valley will not be equal in quantity to the usual output.

Greater scarcity of snow exists in the canyons down the sides of Mount Shasta than for many years which is the cause of a serious water famine in Siskiyou county.

The prune growers of Geyserville have formed a pool of two hundred and fifty tons of French prunes and are holding for a four cent basis. First come first served, writes a subscriber.

Some grape growers at Healdsburg claim to have sold the wine grapes for as high as $14 per ton. One winery is paying $8 cash and balance to be according to prices at which wine sells.

Farmers near Fair Oaks, Sacramento county, are making an energetic campaign against Johnson grass. To that end a permanent agricultural club has been formed, looking after the welfare of the region.

Owing to low bids for the shorthorns of the Gibson Roselawn herd, most of the cattle were withdrawn and will be offered at private sale. The attendance at the sale was quite large but there were more spectators than buyers.

Central California

Turlock claims to have a 21¾ pound sweet potato.

Stanislaus County Fair at Modesto is on during the present week.

Lodi grape growers are feeding their lower grade grapes to the hogs.

The average sugar content for the season at the Visalia sugar factory was 19.5.

Occasionally as high as 25 cars of Tokay grapes are shipped in one day from Lodi.

Many eastern sales of Tokay grapes from Lodi run from $1.40 to $1.80 per crate.

Tulare is to have a seeding plant which will be in readiness for this season's raisin pack.

Irrigationists at Turlock recently voted $100,000 bond issue to increase its irrigation facilities.

Bakersfield is becoming more and more a shipper of butter, most of it going to Los Angeles.

Exeter is beginning work for the coming Tulare County Citrus Fair which may be held December 1-6.

The Sempervirens Club of San Jose is protesting against the defiling of Big Basin park of redwood trees.

The Fresno County Fair Association is pushing work on its grounds to be ready for the coming exhibition.

One citrus nurseryman at Porterville recently let the contract for budding 65,000 seed bed orange stock.

Turlock sent one full car load of cantaloupes which were given away at the State Fair for advertising purposes.

The unusually early dropping of leaves of prune trees in the Santa Clara valley was thought at first to be due to insects but is now believed to be owing to the dry season.

Tomato and watermelon growers along the river above Watsonville have been exasperated by the depradations of small boys who destroy the crops simply for the fun of the thing.

Professor L. O. Howard, head of the entomological division of the Department of Agriculture, and professor Swingle recently visited San Jose to investigate matters concerning the thrips.

One large fruit producer at Lodi has sold his Tokay crop at 70 cents f. o. b. This is considered a good price for this year. The expense of harvesting and packing the crop is about 25 cents per crate. This would leave to the grower about $36 per net ton

A $10 cash prize is to be given at the Tulare County Fair to the farmer, either man or woman, who can show the best judgment as to the quality of dairy cows which they have never seen. Prof. E. W. Major of the State University will be the judge of these judges.

The managers of leading hotels in this state come back at the fruit and vegetable men who have complained of the low grade of fruit served on California tables with the claim that they are unable to buy better grade of products at home because all better grade of stock is sent for eastern consumption. The fruit men maintain that if our hotel men will meet the price which eastern people are willing to pay the finest of fruits and vegetables will be kept at home.

Southern California

Upland has found its colony of Argentine ants.

Up to September 12 Redlands shipped 4721 cars of oranges.

Redlands shipped 1400 more cars this year than she did during 1906-07.

Southern California has shipped to this time nearly 25,000 cars of oranges.

Escondido, San Diego county, gave away over a ton of grapes at her recent grape festival.

A syndicate will plant 200 acres of eucalyptus in Reche canyon, Redlands, San Bernardino county.

San Bernardino is making a strong fight for the issue of bonds for funds for good roads purposes.

Several sections of Southern California have suffered somewhat from shortage of irrigating water.

Some parties have taken up land on the desert near Daggett and will plant to eucalyptus and alfalfa.

The Santa Ana sugar factory which is now building, plans for the handling of beets from 9000 acres next season.

Southern California Walnut Associations are many of them building new salt solution bleaching apparatus.

The most destructive forest fire in Southern California this year was that of La Crescenta, Los Angeles county.

A eucalyptus pile driven into the ocean at Santa Barbara has sprouted and is now sending out a branch of considerable size.

San Fernando is discussing the question of having a "citrus day." with the expectation of making it an annual celebration.

The Montana Land Company at Orange county has a field of 160 acres of sugar beets which averages 10 tons per acre of 2 per cent beets.

Apple trees in the Yucaipe Valley are so heavily loaded with fruit that nearly all are propped up. One ranch placed over 7000 props under its trees.

A San Luis Obispo county farmer has asked for an injunction to prevent State Veterinarian Keane from dipping his cattle for Texas fever-ticks.

The most severe wind storm which has struck the Imperial valley since its settlement visited that community last week. Several houses were blown down.

Articles of incorporation were recently filed in San Bernardino county by the Pratt Eucalyptus Association. It is to grow trees for manufacturing into lumber.

The Chino sugar factory recently made a record for itself of 977 tons of beets sliced within 24 hours. The plant was guaranteed by the builders to slice 700 tons within 24 hours.

Preparations have been made for a full trainload of the representatives of the California Fruit Growers' Exchange from several Southern California points. Riverside alone will send one full car load of delegates.

The ice and cooling plant built by the Pacific Fruit Express Company at Colton will be the finest and largest of its kind in America. The machinery alone for this plant will cost about $200,000 and the total expense will be well up toward a million.

The Coast

Lewiston, Idaho, will hold its annual fair October 12-17.

Pueblo county, Colorado has just launched a $30,000 irrigation project.

North Yakima, Washington, has shipped over 800 cars of fresh fruits this season.

Present price of barley at Portland, Oregon, is $1.30 with some growers asking $1.32.

Apple buyers in Oregon have been very slow in making their offers satisfactory to the growers.

Editor C. B. Minton, of the Northwest Poultry Journal, has purchased the Oregon Agriculturist.

The Hood River, Oregon, people will hold their next Biennial Apple Fair November 14th to 16th.

Washington vetch seed growers are reaping a rich harvest from their sales of vetch, largely to California.

A superb showing of highbred cattle was made at the Pacific National Live Stock Show at Portland last week.

The Yakima, Washington, fruit shippers have a contract for shipping quantities of fruit to a London concern.

The members of Evening Star Grange, Portland, Oregon, celebrated the 35th aniversary of that grange recently.

Lewiston-Clarkson fruit growers have shipped quantities of fruit to Albuquerque to be exhibited at the Irrigation Congress.

Recent rains have caused such bad roads in some sections of Washington and Oregon that shipment of wheat has been greatly delayed.

The Rogue River Horticultural Society has apointed committees which will take steps toward securing irrigation for a large tract of land.

Arrangements are being made for an apple show to be held at Marshallfield, Oregon, as soon as plans can be perfected and prizes arranged for.

A land company at Pendleton, Oregon, has taken steps looking toward irrigation of 7000 acres of land. $150,000 will be spent in the irrigation system.

National Convention of the Farmers' Educational & Co-operative Union held at Fort Worth, Texas, has decided to hold its next meeting at Walla Walla, Washington.

Washington and Oregon wheat growers are much concerned over the pest of smut and are taking steps to so handle their crops another season as to escape this pest another year.

The last year's efforts of the Wenatchee Apple Growers' Co-operative Selling Association resulted more successfully and will result in a stronger co-operative organization next year.

An association of all the apple growers of Albany, Oregon, has been formed and an agreement entered into by which the organization will employ expert packers to handle the output of the community.

The clover seed producers of Northwestern Oregon have produced a larger output of seed this year than ever before. The Chas. H. Lilly Seed Company reports that prices will be about 25 per cent lower than last season.

Even the richest soils will wear out unless replenished by

Potash

Highest yields of grapes of superior shipping quality result from the liberal application of fertilizers containing at least 10 per cent. of Potash. (If you cannot get such brands from your dealer, reinforce your fertilizer by adding Muriate of Potash).

Our booklet, "Plant Food," is full of valuable information about the use of fertilizers. Send for it; it is free.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Manufacturers of Tanglefoot Fly Paper Grand Rapids, Michigan

Pacific Sugar Company's plant at Visalia has about finished its season's run.

Kings County Fair is now assured for this fall and promises one of the best ever.

Deciduous Fruit Culture

CHARGES AGAINST OUR FRUIT.

Recently several shipments of California fruit to Seattle have been condemned and destroyed, as infected by pests. Thereupon Mr. Pendleton, Fruit Inspector at Seattle, says that California is making that port and the Northwest "a dumping ground for diseased fruit," and that "California fruit growers are not spending any money for spraying their trees and plants, but the Washington growers are."

Mr. Pendleton adds that as a result of the spraying, "the Washington fruit is far better than the California brands, and Seattle people in buying state-grown fruit can also have the satisfaction of knowing that they are getting the finest fruit."

We are not denying that careless shipping may have sent infected fruit to Seattle. If so, its condemnation was proper and not subject to just complaint. But we do deny, with knowledge, that California fruit growers neglect spraying or other precautions in the care of their trees. The study of economic entomology began in this State, and in no part of the world is its application to the eradication of fruit pests more persistently or intelligently pursued. A great part of the time of the last annual meeting of the Fruit Growers' Convention at Marysville was taken up in discussing fruit pests and their treatment. Every fruit-growing county in this State has its inspector who compels the destruction of pests if the planters are negligent. More money per tree is spent in keeping orchards clear of pests in California than in any horticultural section in the world.

It is true that notwithstanding all this expenditure of money and labor some infected fruit may appear in the market, for local consumption or shipment. In either case it should be destroyed as a warning to growers and shippers to increase their vigilance. We do not dispute the excellence of Washington fruit, but for climatic reasons California fruit in its variety and excellence yields to none. In the next meeting of our Fruit Growers' Association, these reckless and wholesale charges of Mr. Pendleton will no doubt receive the attention and get the refutation they deserve.—Sacramento Union.

GUMMOSIS OF THE CHERRY.

At the recent meeting of the Northwest Fruit Growers' Association there was a discussion of the disease of cherry trees commonly known as gummosis. From the reports of this discussion it is evident that there is nothing definitely known as to the nature of the disease or as to successful remedies. Even horticultural experts who should be authority differ in their opinions, though all agree that the disease is a serious one, for, if not checked, it results in the death of the tree. Since cherry-growing has become an extensive industry in this state, and will become many times greater in the next few years, it is of much importance that exact information be gathered concerning gummosis and its remedies.

One cherry grower of many years experience asserts that the disease is one of the sap, while another of just as much experience declares it is a disease of the bark, and a third says the oozing of gum from the bark is due to some sort of injury. Another grower is of opinion that over-cultivation or over-irrigation causes the trouble, while others, who have cultivated their cherry trees thoroughly, are just as certain that cultivation does not cause it. Scoring the trees—cutting a number of slits up and down the trunk through the outer bark—is the remedy most commonly recommended, on the theory that the bark fits too tight and that the sap oozes from the tree for that reason. But this remedy has not always been found effective, and even if it is a proper course of treatment, no one seems to know at what season or under what conditions the scoring should be done. Other remedies suggested by those who have tried them are spraying with Bordeaux mixture, rubbing the gummosis sores with blue vitriol, injecting kerosene in the sore. But, since scarcely any two growers agree in their observations and opinions, and authorities differ, the whole subject is one which should receive the most thorough investigation as early as possible, so that the cherry industry of Oregon may be fostered.—Portland Oregonian.

PICKING PEARS.

As most pears become thoroughly mellow only after being removed from the trees, some difficulty is experienced in getting them into a marketable condition without letting them decay. The weather is so warm during much of the pear season that all of the injured fruit decays very rapidly. If, however, care be taken not to pick the fruit until it is thoroughly mature, and to handle it very carefully, much difficulty may be avoided. Varieties differ very much in the length of time required for mellowing after being picked, and in the perishableness of the fruit, some quickly becoming ready for eating, with little loss, and others mellowing so slowly that a large percentage decays before they become palatable.

FARMERS' NATIONAL CONGRESS..

Arrangements for the 28th annual session of the Farmers' National Congress, which opens September 24, at Madison, Wis., are now practically completed. The programme is exceptionally strong and attractive. Some of the leading agricultural specialists of the nation will take a prominent part.

We have been taught that cultivated cherries may be divided into two classes, sweet cherries and sour cherries, and that the sour cherries are again to be divided into two subclasses according whether the juice is light or dark. We believe this classification is correct and our experience has been that it is useless to plant any except the sour cherries, and of those only such as have light colored fruit or fruit in which the juice is light and watery.

Imperial Valley is making a campaign to secure the next annual meeting of the National Irrigation Congress, same to be held at El Centro next year. A strong committee will go to Albuquerque to present the claims of Imperial county.

Live Stock and Dairy

GRAIN FEEDING ON PASTURE.

A question asked every fall is this: "Will it pay to feed cows on pasture a grain ration?" As a rule it is not a paying proposition in California to feed the ordinary cow when the pasture is reasonably good. Usually these dairymen asking this question have waited until their cows have shrunk in their milk below the cost of the labor of milking them. When this is the case it certainly will not pay to add grain to their ration. The cow that has been allowed to shrink in her milk will not respond to a ration that is not succulent. The ordinary dairy cow will increase in milk if she is nearly fresh and the pasture has not been deficient for a great while. A light addition may be made without much expense if the cow is given ten pounds of wheat straw with a quart of middlings each day. The whole matter simmers down to one of cost, and that comes back to the Babcock test for proof. I know of no way that saves waste of feed in the dairy barn better than the monthly testing of the cows. A cow that does not pay for the grain is then cut off from the feeding lists. It pays well, however, to feed at all times a little wheat straw to cows that are grazing on alfalfa, as it more nearly balances their rations.

SHEEP AND GOATS RAISED ON "WEST SIDE" NEAR LOS BANOS, MERCED COUNTY.

Balanced Rations.

The production of any breed of dairy cattle can be raised by balancing the rations with a variety of food instead of feeding one form of nutriment. Corn is the natural balance of alfalfa, is fortunately grown well wherever alfalfa is a crop in California. I have seen fair crops raised in the Coast counties that were only irrigated when started and grew from the dampness of the nightly sea fogs. In the great central valleys of California the corn plant finds a congenial home. The growth is rapid and it continues to grow until one wonders how high it might become if tho forming of the ears and shortening days did not bring it to the end of the season's growth. There are many family cows that have never been developed to the extent of their capacity. Now if a few hills of corn were planted and fed green during the growing season, they would surprise their owners by the increase of milk. The waste of money, or, rather, the misuse of money in buying feed stuffs that we should grow ourselves is a reckless way of farming. While the ordinary American farmer, to his credit, will not live on the food left after even the pigs are fed, and the farmer's wives and children have the best from the farm, this same farmer is not doing all he should do when he buys and pays to others the profit on the grain he feeds to his live stock. He should save that profit as part of his earnings. Corn should be grown for dairy cows wherever it can be grown as a field crop. Its use comes first as green feed directly from the field, and it can be siloed or dried into fodder for dry season use.

Planning a Dairy Farm.

The common way of planting a farm for a dairy entirely to alfalfa is not the most profitable way. In planting a forty-acre place, put thirty in alfalfa and leave ten acres for soiling crops. In the winter season plant the ten in part to barley or wheat and to oats and peas. These crops can be cut to feed green, or they may be pastured off; if any is left, make it into hay; save the little lots, the scraps of every crop. Old Howard, the stable man, used to say, "Save the rimlets and the barn jest biles over full afore yuse knows ut." In the summer sow a portion of the ten acres to Indian corn and pumpkins and the rest to sorghum. Sorghum is like the old woman's name for mignonette, "Cut and Come Again." Sorghum can be cut again and again during the season, and it comes right out again. It has stood the heat this year well, while Egyptian corn is a short crop on account of burning. The soiling of cows with corn or sorghum while on pasture pays well.

Another View.

Now to return to the question as to whether it will pay to feed a grain ration to cows on pasture. While I say No! I mean if one has to buy, with ordinary cows not record breakers. It is not expensive to learn this for yourselves with your cows. There is no way to know if it will pay to feed the particular bunch of cows except by trying it. Take every cow that has freshened within four months, weigh her milk and take a sample for three days, test the sample and make a record of weight of milk and test of butter fat. Then feed the cows on a mixture of 100 pounds of middlings, 200 pounds of bran, and 50 pounds of oil meal. Feed two pounds of this mixture twice a day. After two weeks weigh the milk from each cow for three days; those that have increased in milk retain in the feeding string. At the end of a month, test the butter fat of each cow separately, and if any cow does not show a net profit drop her out. The amount of feed used in such test is not expensive. The present outlook is for high prices for butter fat. The high prices of feed will also crowd many common cows into the market as beef.

Sorghum.

The great amount of hay that can be made from a few acres of sorghum will astonish any one that has never tried it. The mower is set with sickle bar very high and run over the sorghum field when it is three feet high. It is raked into bunches and hauled away to a good drying place. It is left in bunches and turned over every third day until nearly cured, then it is made into larger cocks. After it has sweated the cocks are opened to let it dry. The leaves should be tough and leathery, not rattlingly dry. It is stacked and fed out like other hay. Horses are very fond of it, as well as cows. As soon as the sorghum is off the field, irrigate and cultivate between the rows. In a few weeks another crop will be ready to cut. I have made five cuttings from fields sown the first week in April.

Stacking Green.

Where there is no silo, a sorghum stack can be built. I am always afraid to recommend this as it must be done right or it is wasted labor. I had one man that helped on this work who tried to do it for others and failed utterly.

We start the stack by laying the sorghum down on the ground as close together as possible, putting the butt ends out and making the outline of the stack. Throw the centers in any way so it is reasonably compact. When the pile is six feet high, reverse the sorghum and make a layer of two feet with the heads out. Now if there is old hay or straw, work in a layer of a foot thickness between every four feet of sorghum. Tramp it from the time it is six feet high from the ground. The stack should be high and nearly square as possible, about a half

to two-thirds higher than wide or long. When built up full height, put on a couple of feet of hay or straw.

But I am going too fast. Before covering with the hay, take a corn knife and cut the sides and ends as even and smooth as possible; the cut off stuff can be thrown on the center of the top. Then cover with the hay or straw, rake in into a roof. Take five or six fence boards—I use the 6-inch 16-foot fence board—lay these on the top and staple a heavy wire across them, letting the end come down to within a few inches of the ground. Five wires on boards of the length mentioned is about right. On the ends of each wire tie a weight of twenty-five or more pounds. A well-made stack will mould only a few inches on the sides. In feeding begin on a side that the boards lay lengthwise. Then cut it straight down, taking four inches each day. The secret of keeping the feed is making it firm by tramping and weighting.—M. E. Sherman.

THE DAIRY IN HOT WEATHER

Nothing, not even meats, undergoes more rapid changes during the heat of summer than the products of the dairy, milk and cream. If ice cannot be obtained it is the rule to separate and feed immediately or bottle and deliver at once to customers. Cream is seldom held more than two days and often after 24 hours it has acquired an unpleasant odor which can be easily detected after the cream has been churned and worked into butter. If these changes could be controlled or prevented the dairy business would be more profitable. So writes the Dairy Department of Oklahoma Experiment Station.

It is a well-known fact that where changes take place, as in the souring of milk, there is a cause, and this causal agent may be seen by the use of a powerful microscope. As to form, these causal agents are like strings of beads, like two beads touching each other, or like a lead pencil cut into short pieces. Careful experiments have demonstrated that the various changes which take place in milk, such as normal souring and the production of bad odors, are due to the growth of one or more of these different forms of vegetable life called bacteria. It has also been determined that milk which contains none of these forms, or only those which have been killed by heat, does not sour, become gassy, or develop bad odors. From this we may conclude that if no bacteria are permitted to get into the milk, or if those which do gain entrance are killed by heating, there will be no difficulty in keeping the milk fresh and sweet.

It is impossible, in practical dairy work, entirely to prevent bacteria from falling into the milk, but if the following suggestions are heeded the number gaining entrance and their rate of development will be greatly lessened:

Do not feed dry hay or fodder at milking time, and to prevent dust from rising from the floor use the sprinkling can, for dust means bacteria.

Do not brush the cow just before or at the time of milking, for the dead skin and hairs, carrying thousands of bacteria, will be loosened ready to drop into the pail.

Do not permit the cow to switch her tail over the milk pail, for she is certain to throw hundreds of bacteria into the milk at every flip.

Do not soak the teats or udder with milk or water so that drops fall into the pail, but moisten with a cloth, for a moist surface does not readily permit bacteria to leave it.

Do not regard milking as a dirty task and wear old and filthy clothes, for the handling of food for human beings should be made a cleanly task.

Do not wash pails and cans with cold water, but scald with boiling water and steam; and by all means, avoid rinsing with cold water just before milking, for a few drops of water usually contain several thousand bacteria.

Do not wait to finish milking before beginning the cooling of the milk, but set the can in a tub of cold water so that each cow's milk will be cooled immediately after milking; for a high temperature causes bacteria to multiply very rapidly.

Do not fail to thoroughly clean and scald the parts of the separator each time it is used, for bacteria thrive in the separator slime.

The heating of milk to destroy bacteria or the use of a preservative to prevent their growth has been resorted to, but neither of these takes the place of cleanliness. The first injures the quality of the milk, the second makes it dangerous to health, and is prevented by law. If it is thought that there may be a case of tuberculosis in the herd, or that it is possible for the typhoid germ to get into the milk, heating may be resorted to as a safeguard. To render milk safe from these bacterial diseases, it should be heated to a temperature of 165 degrees, Fahrenheit, for a period of 15 minutes. Milk obtained from tested herds under the proper sanitary conditions will, if kept at as low a temperature as possible, seldom need to be pasteurized. It is as true here as anywhere that "an ounce of prevention is worth a pound of cure."

It is encouraging to note the increased attention now being given by farmers to the testing of their herds by the use of the scales and the fat-test. Next in importance is the determination of the presence or absence of bacteria which cause various changes in milk, cream and butter and bring to the producer a high or a low price for his product when placed on the market. Then the present requirement is some simple test which will reveal to the eye and nose the source of an objectionable germ. To prepare for such a test, several small bottles or vials should be boiled in water for 10 minutes, then drained and stoppered with clean cotton. If these are filled with the milk to be tested and kept in a warm place for 24 hours, the appearance of the sample will indicate the character of the bacteria that are most active. If the milk is unchanged or if it has a firm curd, mostly favorable bacteria are present; if gas bubbles are rising or there is a curd much torn by gas, it is a sign that the milk has been handled in an uncleanly manner or that there is an objectionable germ in the udder of the cow; if there are highly offensive odors being given off, it is a sign that there are bacteria at work digesting the curd of the milk.

Recently a ropiness, accompanied by gas, was the result of heating some of the college milk to a temperature of 175 degs. F. for a period of 10 minutes and allowing it to stand for about 16 hours. A careful examination showed that this was due to the rapid growth of two different kinds of germs which are quite resistant to heat.

FAC-SIMILE OF GUARANTEE BOND

CONGO NEVER LEAK ROOFING

Is Your Roof Guaranteed?

To show our confidence in Congo, we now give a *Guarantee Bond* with every roll.

These Bonds are issued by the largest and best known Surety Company in the United States—The National Surety Company of New York, assets over $2,000,000.

Our 3-Ply Congo is *guaranteed absolutely for ten years.* If it wears out before, the owner is given a new roof *free.*

The Bond means that should we not make good our guarantee, the Surety Company would be compelled to by law. The buyer is thus *doubly protected.*

Congo is the only ready roofing on the market that *dares* to place a Guarantee Bond in every roll.

SPECIAL NOTICE—If any Congo rolls that you purchase do *not* contain Guarantee Bonds, write us at once, telling us where and from whom they were purchased, and we will at once mail you the missing bonds. Write at once for further information and samples.

milk which is being produced under the most cleanly conditions is selling for 10 and 12 cents a quart, while ordinary milk sells for about half that amount. People are giving some attention, and the interest is growing, to the need of a more sanitary milk, especially in the larger cities, and the dairymen who have their herds tested and earn the name of producing a high-grade product are sure to get the higher prices. Butter is being graded more closely every year, and in the future must be made from the best quality of cream if it is to bring a fancy price in the market.

SAND-CRACKS.

A sand-crack is a fissure in the horn of the wall of the foot. These fissures are quite narrow, and as a general rule they follow the direction of the horny fibers. They may happen on any part of the wall, but ordinarily they are only seen directly in front, when they are called toe-cracks, and on the lateral parts of the walls, when they are known as quarter-cracks.

Toe-cracks are most common in the hind feet, while quarter-cracks nearly always affect the fore feet. The inside quarter is more liable to injury than the outside one, for the reason that this quarter is not only thinner, but during locomotion receives a greater part of the weight of the body. A sand-crack may be superficial, involving only the outer part of the wall, or it may be deep, involving the whole thickness of the wall and the soft tissues beneath.

Relative dryness of the horn is the principal predisposing cause of sand-cracks. Excessive dryness is perhaps not a more prolific cause of cracks in the horn than alternate changes from damp to dry. Heavy shoes, large nails, and nails set too far back toward the heels, together with such diseases as canker, quittor, grease and suppurative corns, must be included as occasional predisposing causes of sand-cracks.

Fast work on hard roads, jumping and blows on the coronet, together with calk wounds of the feet, are accidental causes of quarter-cracks in particular. Toe-cracks are more likely to be caused by heavy pulling on slippery roads and pavements or on steep hills.

When the cracks are deep and the motion of their edges considerable, so that the soft tissues are bruised and pinched with every movement, a constant inflammation of the parts is maintained and the lameness is severe.

Insofar as preventative measures are concerned, but little can be done. The suppleness of the horn is, of course, to be maintained by the use of ointments, damp floor, bedding, etc. The shoe is to be proportioned to the weight and work of the animal; the nails holding it in place are to be of proper size and not driven too near the heels; sufficient calks and toe-pieces must be added to the shoes of horses working on slippery roads, and the evils of jumping, fast driving, etc., are to be avoided.

When a fissure has made its appearance, means are to be adopted which will prevent it from growing longer or deeper; and this can only be done by arresting all motion in the edges. The best and simplest artificial appliance for holding the borders of a toe-crack together is the Vachette clasp. These clasps, and the instruments necessary for their application, can be had of any of the more prominent makers of veterinary instruments. These instruments comprise a cautery iron with which two notches are burned in the wall, one on each side of the crack, and forceps with which the clasps are closed into place in the bottom of the notches, and the edges of the fissure brought close together. The clasps being made of stiff steel wire are strong enough to prevent all motion in the borders of the crack. Before these clasps are applied the fissure should be thoroughly cleansed and dried, and if the injury is of recent origin, the crack may be filled with a putty made of 2 parts of gutta percha and 1 part of gum ammoniac. The number of clasps to be used is to be determined by the length of the crack, the amount of motion to be arrested, etc. Generally the clasps are from one-half to three-quarters of an inch apart. The clasps answer equally as well in quarter-crack if the wall is sufficiently thick and not too dry and brittle to withstand the strain.

In all cases of sand-crack the growth of horn should be stimulated by cauterizing the coronary band, or by the use of blisters. In simple quarter-crack recovery will often take place if the coronet is blistered, the foot shod with a "tip" and the patient turned to pasture.

The shoe, in toe-crack, should have a clip on each side of the fissure, and should be thicker at the toe than at the heels. The foot should be lowered at the heels by paring, and spared at the toe, except directly under the fissure, where it is to be pared away until it is set free from the shoe.—From Department Report on the Horse.

IMPORTANCE OF LIVE STOCK INDUSTRY.

In speaking on the subject of cattle raising in California, Judge Peter J. Shields in a recent address said:

"The breeding of live stock in California has many features peculiar to itself, and may well be said to be in a formative condition. The breeding and ranging of cattle of both the beef and the dairy varieties are in a condition of adjustment, and the next ten years will witness many material changes in the manner in which they are conducted.

"California is probably the only one of the Middle Western and Pacific Coast states which does not produce all the dairy and beef cattle used for slaughter. This condition is the more remarkable when taken in connection with another fact, which is that California is the best fitted by reason of soil, climate and food products to produce cattle economically of any state in the Union. The reasons for this underproduction are many. California is not an old state, nor is its population dense. Its agriculture is not greatly diversified, and there is almost an entire absence of the small breeder and of small herds bred and fed upon the farm. The chief reason, however, is that California's energies have been exercised in other directions, and she has subordinated her beef-growing and dairy industries to others which she has carried to a high development. Her first great industry was mining and she produced more gold than any other state in the Union, or other subdivision of the earth. Wheat growing followed, in which she took high rank, especially excelling in the use of agricultural machinery. Horticulture succeeded, and in this particular she is without a parallel. Cattle breeding has waited on these industries; but in the progress of events the day of the cow has come, and the next few years will witness a development and perfection in the breeding of high class cattle which will compare with her present horticultural pre-eminence."

Dehorn your calves before they get so old that that the knife is the only way to do it. A bit of caustic potash rubbed over the horn when the calf is not more than three weeks old will do it as sleek as a pin. Doesn't hurt much, either.

When writing advertisers, mention Cultivator.

Marketing Produce

THE CULTIVATOR gets a great many questions occasioned by the perplexities of fruit and vegetable growers. The fungi, the insects, the drouth, all combine to prevent easy production of the products which are valuable to man. Therefore the farmer who starts out to produce a first-class article finds himself reminded of the remark which Adam heard in the Garden of Eden a great many years ago, when he was told that he must earn his bread by the sweat of his brow.

But as perplexing as these questions are, they are very simple compared to the one most often received at this office, which is, with some little variation, "How may I sell the product which I have been growing for the past year so that I may secure cost of production and some little remuneration for myself?"

The question of marketing the products of the farm is today one of the biggest and we believe the hardest to solve which confronts the farmers. The government is spending millions in scientific investigation in questions which confront our farmers. Occasionally the marketing side is looked at for a moment, but we do not believe any adequate effort has ever been made to throw light on this question. We believe the time will yet come when the department will realize the advantage which may be secured by farmers by co-operative or other methods and will devote a great deal of energy to solving this question.

Meanwhile what is to be done? It is easiest perhaps to answer by asking, Yankee like, what has been done by our most successful farmers? There have been without question some remarkably satisfactory results secured by co-operative methods. In the same breath we may say there have been a few remarkably disastrous results following attempts at co-operation. Notwithstanding that the Cultivator believes it is the only solution for this question.

Only this week the Cultivator has a letter from the San Joaquin valley in which a peach grower says that he noted in the market quotations of the Cultivator that dried peaches were quoted at 7 to 9 cents, and requests us to send him a buyer who would pay him that figure. Perhaps he had not noticed that immediately above the quotation was a little line which stated "wholesale prices are."

This brings us to the consideration of market quotations as they appear in the Cultivator or any other paper, for that matter.

The Cultivator gives more attention to cultural matters than it does to those pertaining to the market. Nevertheless, the weekly quotations are approximately those which prevail in San Francisco and Los Angeles markets. The market rate quoted in the daily or weekly paper applies only to the hour the quotation is made and six hours or three or four days later an entirely different quotation may prevail. The market report therefore gives one the general trend or "feel" of the market, but cannot be relied upon as an exact figure a few hours after it is in print. And this statement applies to any daily or weekly market report you read. This fact cannot be too strongly impressed upon the readers of this or any other paper.

The fact that peaches are quoted at 7 to 9 cents carries with it no guarantee, or assurance, rather, that the producer can send his product here and secure that price. Merchandising is made up of many wheels, and wheels within wheels, so that when the producer with his one little crop comes to market he finds himself up against a very hard proposition. For instance, his little bunch of peaches, be it a wagonload or a carload, may be offered to a retailer at the prevailing price or open market quotation. There is slight chance of his acceptance for the reason that all his goods are largely bought through certain channels and of large concerns which he knows will stand back of his purchases and supply him next week or next month or next year with the same identical goods which he buys today. This he knows the farmer cannot do for his wagonload or his carload is the end of his string until another season.

Therefore the fruit grower goes to a wholesaler. Here again another factor is encountered, in that the wholesaler has dropped into the habit of doing business with a broker whose judgment he relies upon to supply him constantly with a line of goods which

A BUSY MORNING ON THE LOS ANGELES MARKET. THE BIGGEST RUSH IS BE

meets the requirements of his trade. Therefore he turns a cold shoulder to the discouraged fruit grower, who in turn goes to the broker. The broker perhaps passes him on to the packer and large buyer, who makes it his business to buy of growers the country over, process, pack and supply to the trade in uniform packages and with a guarantee of quality.

By this time the grower's patience is exhausted, he has seen three or four profits whittled off of what he knows he ought to get for his product, and finds before him an offer which will not permit him a penny of profit and possibly not the cost of production of his crop.

Again, in the matter of other products, for instance, strawberries. The

This may have been due to connivance on the part of owners of market stalls to bear the market so the discouraged grower would soon accept any price they saw fit to offer. We do not doubt this is often done. And tricky dealers with plenty of capital plainly manipulate the market to their own advantage. They may fight amongst themselves but are united when the farmer appears. Of course when their stocks are long and they want to sell, the effort will be to up hold the market and get good prices. When their supply is short and they wish to stock up every effort will be made to discourage the producer and force down the price. The beating up and down of onions and potatoes for the past few months are examples of

change, which handles nearly $20,000,000 worth of citrus fruits, is an example of co-operation which is commanding the respect of transportation companies and fruit buyers the world over.

The raisin men of the state have organized and succeeded and then gone to pieces, after which reorganization brought success again and they are now more or less disorganized again. It is an exceedingly hard proposition to hold the producing classes together. It is sometimes due to the fact that fear of dishonesty in headquarters prevents all from joining in such a movement. This is a matter regarding which there can be no guarantee, but notwithstanding that chance, we believe it the only wise course left for the producers.

EEN 5 AND 6 O'CLOCK. THIS PHOTO WAS TAKEN AFTER 7 O'CLOCK.

prevailing market price today may be $1 or $1.50 per crate. Say that $1.50 is a fair report of the general market condition on sales which have actually been made. The berry grower offers his load to dealer after dealer who have supplied themselves and he finds himself unable to sell at even a material shading from the quoted price. It would not necessarily follow that the quotations as given were either dishonest or even blundering. He consents to a much lower price, which, after commission is deducted, leaves little to take home. When peaches were quoted at 60 cents on the market recently we saw a peach grower endeavoring to sell as nice peaches as the average of those sold at 60 cents for 40 cents per box. Up to the time of our leaving the market we saw no offers to accept his bid, one-third under the day's quotation.

the manner in which this is accomplished.

This manipulation of the market cannot be prevented by any farmer unless he goes into the market with just as big a club as he is met with when he tries to dispose of his crop. This he surely cannot do when he, or one or two of his neighbors with him attempt to deal with the shrewdest of manipulators who understand the boosting up or knocking down of prices and will usually accomplish these results at their pleasure.

As we said, the farmer must have the biggest club or he himself gets hit the hardest. Co-operation or the bunching together of large quantities of produce all placed under the management of one honest and intelligent man will put the farmer where the buyers will be far more courteous in their propositions. California Fruit Growers' Ex-

The man who expects to dispose of his fruits in the markets of the world ought to understand something about the fruit markets themselves. There are many different markets, and each of them has its peculiarities. For a proper understanding of the matter it would be well for the man who wants to study them to divide them into the retail markets and the wholesale markets. These two have an entirely different sphere, and the one you intend to cater to you should study thoroughly and become conversant with its many features that tend either to lower or to raise the price you may expect to receive for your goods. In this country the wholesale markets are much the larger and absorb by far the larger proportion of the fruits. The retail markets are numerous and growing, and every fruit grower ought to more carefully cultivate them. It is through these that many a small grower will make his most money.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"**THE RIGHT WAY,**" our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CONTROLLING THE MOLT.

A FEW years ago there was considerable excitement in the poultry world over the discovery of Mr. Van Dresser of New York, that he could control the time of molt in his flocks. During July and August Van Dresser made his hens molt and grow a new coat of feathers that they might be ready to produce high-priced eggs in November and December. For two weeks the hens were kept in a pen and fed very little, and then they were let out and fed a highly nitrogenous ration and particularly sun flower seed. This soon loosened the old feathers. Under the high feeding they soon grew a new plumage, their combs got red and with every appearance of health they were ready to lay eggs at the proper time.

The idea was not a new one at the time Mr. Van Dresser tried it. We are told of a New England farmer who had adopted the plan several years earlier. This farmer's method was to select 30 or 40 of his hens, put them in a colony house in a pasture lot where there was shade and water. After they were used to the new house they were turned out and given the run of the lot. They were fed once a day a light feed of grain. This was continued a month, at the end of which time they were reduced considerably in flesh and were in a good vigorous condition. They were then fed a good grain ration with considerable beef scrap. Under this treatment they molted immediately and in three or four weeks were well clothed with a new set of feathers and laid abundantly during the fall and winter.

In the fall of 1902 the West Virginia Experiment Station tested the system with two pens of White Leghorns and two pens of Rhode Island Reds about two years old. One pen each of Rhode Island Reds and White Leghorns received no food for thirteen days, except what they could pick up in their runs. The other two lots of fowls were fed as usual on mash, beef scrap, corn, wheat, etc. After the expiration of thirteen days, all four lots were fed liberally. Each flock contained twenty hens and two cocks.

The following table shows the number of eggs produced during the first 30 days after the test began.

1. Rhode Island Reds, fed continuously, 75 eggs.
2. Rhode Island Reds, no food, 17 eggs.
3. White Leghorns, fed continuously, 172 eggs.
4. White Leghorns, no food, 25 eggs.

Lots 2 and 4 ceased laying on the seventh day of the test. Thirty days after the test began the "no food" pen of Rhode Island Reds had practically a new coat of feathers and had begun to lay and in a week from that time one-half the hens were laying regularly, while the other lot of Rhode Island Reds were just beginning to molt and the egg production had dropped to two or three eggs per day.

Both lots of White Leghorns were a trifle slower in molting than the Rhode Island Reds, otherwise the treatment affected them in the same way. The conclusions drawn were that mature hens, which are fed sparingly for about two weeks and then receive a highly nitrogenous ration, molt more rapidly and with greater uniformity and enter the winter in better condition than similar fowls fed continually during the molting period on an egg-producing ration.

There is no doubt about being able to produce a molt by the method indicated and if fed properly the hens will grow a new coat rapidly.

The mistake is made by many of forcing the molt too early in the season. If this is done the hens are apt to go into a second molt later on and be molting all the fall. A starving process at the beginning of the natural molt and then liberal feeding will hasten matters and at the same time avoid the second molting period. —S. S. T.

POULTRY BREVETIES.

Ventilation.

I believe with the Cultivator that a good disinfectant liberally used in the poultry houses is a better investment of time and money than doctoring sick hens, but I am at loss to know what to use to get the best results at the least expense. Will you kindly advise? We have two houses; each is 8 x 12 feet, shed roof, four feet at the back and six feet at the front. There are no windows but a door in each end. Do you think a window would be an improvement? We are keeping 25 hens in each house; do you consider that too many for such a house?

Kerosene emulsion is an excellent insecticide and if a pint of crude carbolic acid be added to four gallons of the emulsion it becomes a good disinfectant as well. Zenoleum, a disinfecting preparation much used, is excellent and easily prepared by simply adding it to water. This can be prepared for about two cents per gallon ready to apply. It is well to keep the inside of poultry houses covered with whitewash, as it fills up the cracks and gives less place for vermin to secrete themselves, consequently spray gets at them more readily.

If the houses have no windows. I would cut in the front an opening two feet by two feet, six inches, and tack over the same muslin, or during the summer it may be left open with wire netting tacked to the inside. Twenty-five hens are not too many for such a house. S. S. T.

* * *

Fruit For Poultry.

Will it injure chickens in any way to be fed tomatoes, watermelons or pumpkin seeds? What is good to put on a kitten to keep fleas off?

The eating of tomatoes, watermelons and similar seed will in no way injure the chickens. Dusting frequently with Persian insect powder will tend to keep the kitten free of fleas.

PIGEONS FOR PROFIT.

Good stock is the secret of success.

A lack of vigor offers inducements for disease.

The squab raiser and the fancier are occupying entirely different fields—the former for meat, the latter for feathers.

It is a mistake to allow food con-

tinually before the birds, as tho old ones are apt to help themselves from time to time, but neglect to feed the young in the nests.

Homers are of such a rugged condition that they thrive in any part of the United States or Canada in all seasons.

Keep the visitors out of the loft, as their presence excites the stock and does harm.

Some permanganate of potash, enough to color the bathing water crimson, it is said, will help to keep the young birds in good health.

Pigeons are great bathers, the young ones getting in the water and having a good wetting as soon as they can fly.

A good sized colony of mites will sap the vitality of a pair of squabs in forty-eight hours.

If the old birds with eggs appear uneasy and leave the nest very frequently to indulge in nothing but picking themselves, investigate at once, and you will probably find lice.

The American Stock-Keeper says that if one of the flock should choose to be "cock of the walk," and fight for possession of the main portion, the plan of scattering feed about on the floor allows the timid to partake. Much can be said in suport of this system of feeding on the floor, as it provides a natural way to keep the tips of mandibles in proper trim, thus doing away with any necessity of cutting for sake of comfort.

One can readily detect musty and unpleasant odors when mice have overrun a loft.—Farm Journal

THE IMPORTANCE OF STRAIN.

While the different breeds of utility poultry are divided into three distinct classes, the fact of a bird belonging to one class cannot be taken as an absolute guide to its characteristics, because there is the very important question of strain to be considered. It is extremely difficult to describe in so many words the exact meaning of the word strain, but perhaps I may be permitted to give an example which will serve the purpose better than a definition can possibly do. Say, for instance, two men decide to commence poultry keeping with a pair of White Wyandottes, and say further that both procure their birds from the same source. One man wants to specialize in winter egg production, and during a period of ten or a dozen years he systematically selects his breeders with this end in view; he is quite unconcerned how the table qualities may be neglected; all he cares about is to increase the number and size of his eggs. The second man, on the contrary, is anxious to improve their table characteristics, and he likewise for a similar period selects accordingly; he is indifferent to the fact that his stock may be degenerating as layers; all he cares about is to make the chickens good edible birds. At the end of ten or twelve years both men possess White Wyandottes, it is true, and anyone judging the qualities by rule would imagine that both flocks combined the two essential features of table and laying, whereas, as a matter of fact, one flock would consist of admirable layers with poor table qualities, and the other of splendid marketing chickens with poor laying powers. While, therefore, the breed of the fowl denotes certain qualities, it cannot be taken as altogether conclusive.

The Sacramento River is lower this year than it has been in over thirty years.

COLOR OF EGGS.

A recent bulletin from the Department of Agriculture on the color of egg shells, says:

"It is a matter of common observation that hen's eggs vary rather widely in color, ranging from a clear white to a decided light brown. Domestic poultry have descended from several wild strains, the various breeds being formed by numerous crossings. The color of the egg shell,it is generally believed, is a characteristic which has been transmitted from the early ancestors of our modern breeds.

"There is no constant relation between the color of the shell and the composition of the eggs, although there is a popular belief in some localities that the dark shelled eggs are 'richer.' That there is no difference in the physical properties and chemical composition between brown shelled and white shelled eggs was shown by investigations carried on at the California and Michigan experiment stations, this work having been summarized in earlier publications of this department.

"The color of the shell has, however, an effect upon market value, and brown shelled eggs bring the higher price, for instance, in the Boston market, and the white shelled eggs in the New York market. In England the tinted eggs.

"One great advantage which all breeds producing tinted eggs possess is that they are in general better winter layers than the varieties producing white shelled eggs, this being perhaps due to the fact that they are usually very good sitters and mothers, and so obtain a rest during the spring and summer months."

THE DUST BATH.

The dust bath may apparently be a matter of little importance, though in fact it has happened that success or failure depended upon this necessary adjunct to poultry keeping. No flock will thrive unless dust is supplied, and strange as it may seem, dust is a scarce article in some poultry establishments, as many poultrymen do not consider it worth their while to provide it. Without the dust bath lice will overrun the bodies of the fowls. Whatever the material used for the dust box may be, it should always be dry and fine, so that it will fly in every direction. When the hen dusts herself it is not for the enjoyment of wallowing in it, but to throw the dust over her body; hence, if the material used is not dry and fine, it will be of little service to the hens. Ashes are often used, but there is a difference between those produced from wood and those from coal. They should be carefully sifted, and either kind may be used in dry weather. Should a wet spell come on, however, the wood ashes should be avoided, as the contact with moisture renders them injurious to the skin, owing to their caustic alkaline properties. It is usual, on large poultry farms, to store road dust in summer, so as to have a supply in winter, as road dust is one of the best materials to be found for the purpose; but any kind of fine dirt will answer if it is dry.—Farm and Fireside.

HAVE PATIENCE.

Patience is something that the poultryman must have an abundance of. A shortage of it has been the cause of many failures. For instance, a plan of feeding has been decided upon and followed up long enough, as the owner supposes, to bring about the desired results, but days and weeks pass and no eggs are produced, until finally the owner begins to have doubts about the correctness of his plan; he changes the ration, increasing or decreasing, and goes on, perhaps, for two or three weeks changing about, until finally the hens are not so near the laying point as they were when he commenced with them. Good judgment and lots of patience go hand in hand in the poultry business.

Hens that are given a variety of food, just enough during the greater part of the day to keep up their inclination to dig and scratch for more, then all they will eat up clean before going on the roost, should produce eggs, provided they are healthy and comfortably housed. Those who have not given any special attention to examining their hens closely are not aware of the very unfavorable condition for egg production they may have been in when they started to get them to laying. Some hens lay more eggs than others under the same conditions. It is natural that they should; it is in the strain and breeding; but all properly-developed hens will produce some eggs, and do it in the winter, if rightly handled. The main thing for the attendant to do is to keep everlastingly at them.—Country Gentleman.

CROP DROPSY.

"Crop Dropsy, Soft Crop, Cropsick, are all names used to denote a distension of the crop by foul watery fluid, with general ill-health. There is little doubt that profuse drinking is often a cause of this. The crop must be evacuated, holding the bird head downward, twice a day: feeding rather scantily an hour afterwards with biscuit-meal in which grains of wheat are mixed, moistened with brandy and water. In the water should be placed some quassia chips and a little tincture of perchloride of iron. First of all give 30 grains of Epsom salts. In some cases, about three grains of iodide of potassium daily seems of marked benefit, but in others we were unable to trace any effect to it."

Egg-More

Not a strong tonic and stimulant, but a highly nitrogenous Poultry Food very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs when they are scarce and high. If not sold by your dealer, we will prepay freight on 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs., $7.00. Send for free Booklet with testimonials.

$50 Cash Premiums

$20 first; $10 second; $5 third; fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you and no peddling or canvassing. And to each one competing, we will also give a useful article. Send postal for particulars mentioning this paper, to

GOLDEN RULE NURSERIES

Agents Pac. Co. States Loomis, Placer Co., Cal.

An investigation of the onion conditions of Western Oregon finds that crop will be somewhat lighter than that of last year and that the crop is of magnificent quality.

Small Fruits and Vegetables

TIME AND WORK SAVERS.

BOTH ends of every row of vegetables should be marked with a stake, so that you will know where to weed and cultivate without hitting the line where the young vegetables are coming up. Weeding before the young food plants are more than a one-leaf or two-leaf stage high will save many of them from being smothered. and will give all of them such a good start that the weeds will have a hard time catching up. But you will find it a sad job to weed without cutting off the young vegetables unless the rows have been plainly marked.

Each of these stakes should have one side smoothed off so that you can write on it in pencil the name of the plant, when it should be thinned and how much, when it should be ripe, etc.

Always have a long, narrow board near the patch—narrow enough so that it can be laid between the rows without touching the crops. This will be found invaluable when picking or weeding on wet days or after irrigation, not only because it will save your shoes and clothes, but also because it will save you from tramping down the wet earth and perhaps a whole row.

Buy a skein of the tying stuff called raffia. You can get a lot for 15 cents Hang it somewhere where you can get it in a minute. It is worth all the rope and string that ever were for tying things up in a hurry and making them stay tied.

Whenever you cut a straight branch or find a straight slender stick anywhere put it aside for a stake. Everything will seem to call for support at once. A mad search is then generally made by amateurs, with the result that most of the plants either do without and go to ruin or get staked to such miserable makeshifts that the whole garden is disfigured.

IN THE ORANGE COUNTY CELERY FIELDS.

The ranchers of the Antelope valley have planned for a rabbit drive in which they hope to round up forty thousand or more jacks.

CELERY PLANTS GOING TO SEED.

Celery planting is now in order and the experienced grower is undoubtedly striving to guard against loss by plants going to seed. This tendency in celery plants to throw up seedstalks when grown in semi-arid districts is very marked and is the cause of much loss each year.

The wild celery from which our cultivated forms have been evolved is a native of moist climates in many portions of Europe, Asia, and northern Africa. In fact in its native state it is a swamp plant. Although celery has been cultivated for centuries, and under many conditions, it is still a moist soil and a moist atmosphere-loving plant. While it is true that Colorado-grown celery excels in quality yet it is well known that it requires more skill on the part of the gardener to grow this crop successfully under our conditions than it does in sections where rain is abundant.

The growth of seed-stalks the first season is, of course, abnormal, as the plant is a biennial. The opinion of those who have studied the subject is that such plants have always received a check in growth which corresponds in a measure to the rest that such plants take during winter. Under semi-arid conditions such influnces are intensified; so much so that it seems at times as though the cause could not be accounted for.

Growers have found that if they can keep the plants growing steadily from the seed bed to maturity loss from this cause is small. This is desirable, of course, with all classes of plants, but the celery plant happens to be extremely sensitive. The way plants are handled before they are transplanted to the field is important, as it is quite common for hot bed grown plants to go to seed. On the other hand, plants grown in greenhouses, if well grown, give good satisfaction; however, most growers must depend upon cold frames, and such plants seem to be most reliable

The best soil for celery growing is loamy river bottom land. Such soil is inclined to be moist, but not soggy, and does not bake. Given such soil and a reliable water supply the skilful grower finds but few seed-stalks in his field during the season, providing the conditions in the seed bed were right.—W. Paddock, Horticulturist, Colorado Agricultural College.

STRAWBERRIES.

Strawberries will be taking a rest in September so far as fruitage is concerned, unless the vines are young, but unless the vines are too old for profitable bearing, good treatment now in the line of irrigation and cultivation will insure more or less berries until winter. The life of the strawberry plant is not as long as the blackberry, but under good treatment a bed will bear for six or eight years. In the Eastern states, where irrigation is not practiced, they have to be renewed every three or four years.

Speaking of the cantaloupe failure this year and looking to the future, the Imperial Standard says:

"But the best remedy the Standard can see is the passage by the supervisors of an ordinance which will bar the shipment of any green or inferior fruits or vegetables from the county, and the appointment of disinterested inspectors to see that the ordinance is rigidly enforced.

"There is only one hope for the industry, and that is in establishing a high repute for the quality of the output, while the whole tendency of the past season has been to destroy any such reputation."

True as preachin' every word—not only of melons but of other products as well.

EUCALYPTUS TREES

The Ornamental Garden

HOW TREES ARE MADE SYMMETRICAL.

The correction of the forked or defective crotch that is found to a great extent in our soft maples and elms and to a less degree in almost all our landscape trees forms a large part of the "tree surgeon's" work, says Cement Age, New York. This form of crotch usually has its origin in the destruction of the original head or leader. In a case of this kind a double head is formed by the forcing out of two lateral buds. As these shoot up, forming the new top, the old stump at their base gradually decays, allowing water to penetrate into the crotch. Nature tries desperately to heal this wound, but the imperfect joint is constantly forced open by the wind and prevented from uniting by the old stump, until finally, weakened by decay, the tree splits. Many of our finest trees are ruined every year by the splitting of these defective crotches.

These cases are often exceedingly difficult to treat. The decayed matter must first be removed with great care and thoroughness—in fact, the dentist is not more conscientious in removing decay from a tooth than is the "tree surgeon" in cleaning out the cavities. The opening is then packed tightly with eement or a preparation of oakum, tar and paint. Cutting watersheds in these crotches often takes all the workman's ingenuity and patience, for, working in the narrow limits of the fork, as he is compelled to do, it is exceedingly difficult to use his tools. But here most of all a perfect watershed is required, as the water running down the limbs and trunk would otherwise find lodgment behind the filling. In the case of a large tree the additional precaution is taken of putting a bolt directly through the crotch, while a chain is placed some twelve or fifteen feet up.

The old method of placing an iron band around a tree to prevent splitting often caused death, or at least deformity, for as the trunk or branch grew in circumference the strieture cut off the flow of sap, depriving the top of nourishment. The improved method consists in placing bolts directly through the limbs and securing them on one end by washers and nuts, while on the other a hook is formed, over which a chain is placed. This serves as a stay, enough play being given in the chain to allow the crown sufficient swing or way.

Fully half the cases of decay of the limbs or trunk were originally caused by improper pruning. Eight out of ten men in cutting off limbs will leave a stump projecting five or six inches. The bark along the circular edge deprived of nourishment dies back, leaving the face of the cut exposed. The unprotected cells eannot resist exposure, and decaying, leave the heart of the tree exposed to myriad enemies. In many trees the cavity caused by the decay of the heartwood is large enough for a man to stand upright in, the entire trouble having been originally caused by a cut of not over eight inches.

Every cut should be made as close as possible, in order that the sap rising through the cambium layer may cover the wound with new bark. Where large branches are to be removed the first cut should be made from below, so that as the branches fall there will be no tearing down of the sapwood or bark. The second cut is then made from above. In order to protect the exposed cells they are painted with a preparation of coal, tar and paint. Where the cut is soft or of unusual size a cap of zinc is fitted to the exact size of the cut just inside the bark and nailed tightly down to prevent moisture from reaching the exposed wood. The new layer of bark will eventually completely cover the zinc, leaving little or no sear.

The Calladium.

About a year ago the Cultivator printed the following, which was written for its columns by Josiah Forest Kennedy of Los Angeles. It was reprinted in several other papers and one, the Florida Agriculturist, remarked: "We have read of 'sermons in stones,' but we have seldom seen anything finer than the following." We believe it worth repeating:

What a teacher Nature is! Her students find songs and sermons and lessons on every page of her great open book. Did you ever get the lesson suggested by the calladium—that great elephant-eared-like plant so common on our lawns? Just watch its development. Each germ of its bulb or tuber sends up a single shoot or stem which soon after leaving the ground develops into a leaf, though small and insignificant as compared with other leaves developed later and in succession from this first one. Folded in this leaf-stock born soon after this first leaf has fully expanded. is a second which has an ambition to be larger and more perfect than its parent, an ambition that is fully realized, if it lives. Its leaf-stock in turn furnishes another leaf, larger and better in every way than its parent, and thus there is a progressive development until the last leaf is many times larger and more beautiful in form and shading than its original.

Should there not be a similar development in human life and character? Ought not the son and daughter with the added opportunities that come to each successive generation be stronger and greater intellectually, morally and physically than their parents—whether these parents are poor or rich, low or high, unlearned or learned, vicious or virtuous, sick or well?

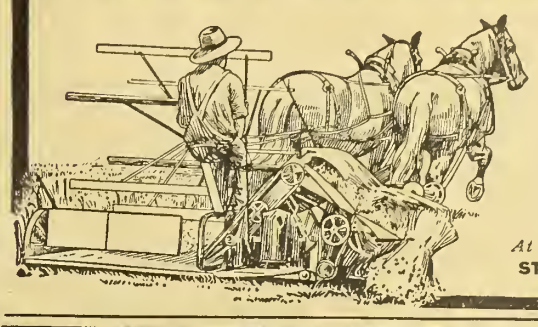
If every boy and girl, in every home in every land should imitate the calladium in growth and development, if they should put forth every effort to be better in every way than father and mother, this old world would soon be a veritable Paradise, with precious little use for constables or sheriffs, for prisons, poor-houses or police. Nor would there be nearly so much use for lawyers, doctors or even preachers.

Let us be calladium-like—let us be progressive.

SAVING FARM MACHINERY

Few things are of more vital need around the farm than a first-class, heavy machine oil. It makes machinery last longer, lessens friction, helping the horses do more work and better work.

RUDDY HARVESTER OIL



has plenty of body, is the ideal oil for farm use, and as it goes farther it is more economical. Try it on Harvesters, Tedders, Feed Cutters, or Mowing Machines. You will find that it never gums or grows rancid, never corrodes, and works freely under all conditions. It is an oil that "stays put," reduces friction to a minimum, and is unequaled by any Harvester Oil on the market. Comes in oue and five gallon cans, half-barrels and barrels.

At all dealers in Farm Machinery.

In Writing, Address

C. C. Morse & Co., 41 Jackson St. San Francisco

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Grape Juice.

I have read with much interest your answers regarding putting up of grape juice. I put up some last year, using the boiling process, but used no sugar. If one should wish to put up on a larger scale where could he write to secure prices on small press, and could you tell me where, near this city, it is put up for the public?—Mrs. C. F., San Bernardino.

Toulouse & Debrioux of San Francisco can probably supply you with a press for this purpose. Louise Cary Smith of Pomona is producing an exceedingly fine quality of grape juice and she is, so far as we know, the nearest to you of anyone engaged in that work.

* * *

Dried Fruit Wanted.

I write to the Cultivator to ask if it can get me in touch with people who have dried fruit, beans, nuts, etc. I mean people who will sell to us at wholesale prices as quoted in the Cultivator, or the same as the producer receives from the regular buyer, and yet sell in small lots to us who consume? I believe there are many readers who would be glad to buy direct and thus save wholesalers' profits.—S. T. Merrill, Yuma.

The writer of the above expects rather too much to ask the producer to put up in small packages, say 50 or 100 pounds, and haul to the freight depot for the same price for which he would haul by the ton and deliver in bulk to the buyer. There is, however, a suggestion in this letter which may be of value to producers of dried fruits, nuts and beans. There is a company located at Colton, we believe, which makes a business of delivering anywhere in the United States products as mentioned by the above inquirer at very reasonable prices.

* * *

Grafting Pecans.

Can pecans be grafted successfully on the black walnut?—Subscriber, Princeton.

The pecan belongs to the same family as the Hickory, Carya, or, according to some botanists, Hicoria; these two being sometimes united by grafting . While allied to the walnut (Juglans), botanically, it could not be recommended to use the black walnut as a stock for the pecan, except in an experimental way.—Leonard Coates

* * *

Washington Grapes.

In this upper country our grape vines start growing the first of April and are invariably killed back to the ground in the latter part of April by the late frost. Please tell me if there is any system of pruning by which I can remedy this evil. Also please describe powdery mildew. Is there any difference between the Black Prince and the Rose of Peru? At what age does the Emperor come into bearing? What is meant by trimming before pruning? Will you kindly advise me as to the best and most prolific bearing blackberry to plant for early market. Is there any of the so-called California vine disease in Fresno county?—L. S., Kennewick, Wash.

Prune your vines late in March, which will cause them to bleed severely. This will cause them to start late.

Powdery mildew gets its name from the appearance of the gray dust that is the spore dust of the fungus. It comes on the leaves and fruit.

Black Prince and Rose of Peru are synonyms.

Emperor comes into bearing at three years when grown in a warm climate. It will perhaps bear a few grapes the second year, but not in paying quantities.

Trimming the vines is cutting off the ends of the long canes during the growing season.

Crandall's early blackberry is perhaps the best early blackberry grown. The Garden Dewberry is earlier and more prolific and is taking the place of some of the early blackberries in some sections.

I do not know what you mean by the "California vine disease." If you mean phyloxera, it is present in certain sections of Fresno county, and some of the bay counties also. If you mean the Anaheim disease, it is found from one end of the state to the other.

* * *

Fungous Disease of Leaves.

What is the matter with my peach tree? The leaves are all falling off and the tree looks as if it is going to die. This has been going on for about three weeks. When it first started the peaches were about the size of a walnut. They have not grown any since nor have they shriveled up.—L. B., Oakley.

You no doubt have a fungous disease of the leaves. Send specimen leaves.

* * *

Plums.

We have a plum, very small pit, perfectly round, is large and deep red from surface to pit; more juicy and not so acid as the Satsuma. Is there a plum answering the above description of the Chabot plum.—E. B., Santa Ana.

We cannot name your plum unless it is a Prunus Pisardi. That variety has red foliage. Chabot, greenish purple, very large and firm; tree vigorous and a good bearer. Wickson. It is a Japanese plum.—J. W. M.

* * *

Drying Figs.

Please give information through the Cultivator about drying of figs for the market.—Subscriber, Corning.

If figs are allowed to become perfectly ripe and sweet, they make a delicious product if simply placed on trays and in the sun until sufficiently dried. They should be turned occasionally during the drying to prevent moulding; some often turn twice a day. The tray is the same as that used for drying raisins or any other which may be be convenient. Sulphuring before placing out to dry is practiced by some and it is claimed accelerates the drying and prevents souring. They should be covered on a foggy or damp night to prevent discoloration. After drying they are sweated by placing in the sweat boxes for the purpose of equalizing the moisture, then before packing are run through a steam bath or dipped for a minute in boiling salt solution.

* * *

Bottle-Neck Melons.

What is the cause of watermelons growing bottle-necked? Some of my watermelons get yellow on top side, look like they had been sunburned. Is it the heat or anything else that is the cause?—A subscriber.

I have never seen watermelons grow bottle-necked. If yours did it was undoubtedly due to crossing with some of the squash or gourd family.

The other trouble is sunburn due to intense heat with sparse foliage. Melons that are kept growing vigorously so that the foliage is abundant seldom sunburn.—Q. A. L.

* * *

Dry Pasture.

I would like information in regard to the kind of grass which would do well on dry, red, poor soil, and make good pasture which would not have to be reseeded each year.—Subscriber, Cottonwood.

A grass such as Subscriber asks about would indeed be a valuable one for California. Government experts and experiment stations hope sometime to produce such a grass, but it has not yet been given to the farmer. Burnett has been suggested as one of these. Paspalum has been recommended and at the Tulare experiment station has done fairly well under extremely dry conditions, but it is very difficult to induce seed to grow without plenty of warmth and moisture. Once thoroughly rooted it does well.

* * *

English Walnuts—Pear.

Can you tell me, through your valued columns, if English walnuts can be grown in the country surrounding Willits, Little Lake Valley and Round Valley? Have seen the California black walnut trees that were 35 feet high, 2½ feet in diameter and full of nuts. Is that any sign that English walnuts will grow? Also where can I get Comice pear trees for planting?—A Subscriber, Greenfield.

English walnuts should do well in your section of Mendocino county They should do well any place within the influence of the coast. We would try grafting a few on the native walnuts.

Try some of the nurserymen who advertise in this paper for Comice pear.—J. W. M.

(We note Fancher Creek Nursery Co., Fresno Cal., catalogue. Doyenne do Comice, a French pear of much promise. Ed.)

* * *

Freak Chrysanthemums.

I have a bed of chrysanthemums coming on early and are now beginning to bud. They have made a very rank growth and the crown bud (the one I have always left on, years before) is a freak, consisting of nothing but green petals. How shall I bud them and what causes this?—E. M. G., Watsonville.

I have never had this trouble with the chrysanthemum, but have with roses. It would seem to be a case of over-feeding—although I had come to believe that was hardly possible. For many years I grew the chrysanthemum for exhibition but do not remember of a single instance of the trouble referred to. As to treatment, I should cut off all the freak blossoms, but if you have freely disbudded over the remainder of the plant the chance for blooms is small. Q. H. L.

* * *

Horticultural Commission.

Will you kindly state in the columns of your paper what is done, and how, in the citrus counties north of San Diego county, for the enforcement of the state laws concerning the destruction of citrus pests, red spider, silver mite and the various kinds of scale. A statement of what is done by the county officials, and how, in one or two of the counties most alive to the welfare of the citrus industry, will be sufficient.—A Subscriber, Lemon Grove.

We do not fully understand what the subscriber desires and to give the full outline of work of the Horticultural Commission would occupy vastly more space than is at the command of this department. But in a word the first step is the appointment of the Horticultural Commission under the state law. This must consist of three commissioners and be, we believe, chosen from different sections of the county. The expense of this commission has been such as to deter some of the smaller counties from complying with this law and none has been appointed. In some other counties the full commission has been appointed with the understanding that but one member shall be active and under salary, the other two honorary and advisory. This commission often recommends to the County Supervisors ordinances which are passed and enforced, this in addition to the state law. The Commission also appoints district inspectors whose duty is to inspect importations of fruit, nursery stock, and orchards all over their district. If the orchard is found infested, notice is served on the owner to clean up, which, if he fails to do, is done by the commissioners, the cost of which becomes a lien upon the property. The success of this commission in eradicating a dangerous pest from the fruit district of any county rests more upon the earnestness and intelligence with which the inspectors act rather than upon the laws. Copies of the special ordinances of the various counties can probably be had by addressing the secretary of any of the horticultural commissions at the county seat.

* * *

Curing Olives.

Please give through your valuable paper information as to when olives are ripe enough for pickling, also how it should be done.—J.

Olives are not necessarily ripe when the pickling is done though many prefer the ripe fruit. If not desired perfectly ripe they may be gathered when beginning to show the tinge of purple. That is, we refer to the Mission variety. If desired perfectly ripe, then of course they become almost perfectly black or at least a very dark purple. Regarding curing, see article on another page of this issue.

* * *

Bleaching Walnuts.

Will you please inform me through the Cultivator as to up-to-date formula for bleaching walnuts?

The above came to this office as appears above, without signature of so much as an initial and without the location from which it was sent being given; other than the blurred postmark showing Nipomo to be the postoffice from which it was sent. We do not see why so simple and innocent a query as that should call for the sending of an anonymous letter. We do not care to talk to a person who would refuse to show his face and continually stand behind

Write for Samples and Booklet of REX FLINTKOTE ROOFING and see for yourself
J. A. & W. BIRD & CO., 89 India Street, Boston, Mass.
PACIFIC COAST AGENTS: W. P. Fuller & Co., San Francisco, Sacramento, Oakland, Stockton, Los Angeles, San Diego, Portland Seattle, Tacoma, Spokane.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

a blanket; neither will we answer more queries which come from persons who neglect to sign their names.

There is no necessity whatever for putting the name in the paper should the party so wish, for had the above letter come with the letter X or any other letter signed to the query, then below, the full name of the writer could have been given and never been published in the paper.

* * *

Cracked Hoof.

Please tell me through the Cultivator what to do for my horse's front hoofs. They are cracking badly which causes him to limp. The cracks extend from top to bottom and have been so for over a year. Is it a serious trouble? Also wish to know if the roots of black eyed peas are dangerous cow feed.—C. E. M., Iomosa.

Regarding the serious cracking of the hoofs we refer the reader to article on "Sand-Crack" on Live Stock page of this issue. We do not think the roots of black eye or other peas would be objectionable at all if fed to any stock.

* * *

Budded Loquats.

I would like to ask through the query column if the growth of budded loquats is the same as that of the seedling. Also which is the best for this climate, Advance or Triumph? I am also interested in the producing of the alligator pear and would like to try one here. Where may I obtain one?—Subscriber, Santa Rosa.

The question regarding the best variety of loquat for the Santa Rosa section has been referred to Mr. C. P. Taft of Orange who is thoroughly posted as to varieties in question There is no difference in the growth of the budded loquat and the seedling, excepting that the budded, of course, like the budded or grafted fruit of any kind does not vary and the bearing quality and grade of fruit is known in advance, while the seedling may be of the poorest or of the best quality. We think also that plants of the alligator pear may be had from Mr. Taft.

* * *

Gumming of Orange Trees.

I am sending you a small limb from an orange tree that I cut back this spring which had been badly gophered. I will be glad if you can give me any advice what to do and also please tell me if it is very serious. There is a small ant which seems to be fond of these trees.—J E. L., Highland.

The above was referred to R. E. Smith of the Pathological Laboratory at Whittier who answers as follows:

The gumming is an effect of injury from heavy pruning rather than from the effect of gophering. Cutting the tree back would bring about such a gumming. If this specimen is typical, that is, if the gum encircles the limb wherever it occurs, no remedy should be recommended. If not, simply give the tree good cultural care. If the tree is badly gophered the best thing to do is to take it out.

* * *

Alfalfa Grinder.

Please tell me if there is a small machine on the market for grinding alfalfa into meal. We have 150 pullets and the ordinary alfalfa meal is rather expensive.—L., Turlock.

We know of no machine similar to the one asked for, but know of several poultry yards where a good feed cutter has produced an article almost equal to the ground alfalfa by being set so as to cut the alfalfa very short. These short clippings were then steamed, or at least sometimes are, and eaten with relish by the poultry. One poultryman we have seen considers this method of feeding alfalfa superior to the finely ground product.

* * *

Ticks.

Will poultry ticks kill chickens? If so, how may we rid houses of them? Our houses were bought second-hand and thoroughly fumigated with sulphur and we are careful to keep houses clean.

Also would like to ask, is it necessary to feed chickens grit where they have a run of nearly three acres of gravelly land?—H., Riverside.

Ticks are one of the most troublesome pests, when they are once established, of any that the poultryman has to deal with. Spraying with distillate or with some of the other strong lice killers, or fumigating with burning sulphur are perhaps the best remedies. Insect powder and greasing of the poultry is the best immediate treatment.

According to some authorities feeding of grit is entirely unnecessary. Be that as it may, in the case you mention where the poultry is on gravelly land, we do not think anything will be gained by feeding any additional grit.

* * *

Harvesting Beans.

I have ten acres of dry beans of the vining variety, which have been irrigated in open ditches. What is the best method of harvesting and can they be threshed in the ordinary grain thresher?—Subscriber, Princeton.

We do not know what is meant exactly by "vining" variety, but the method of cutting Limas is to cut with tool similar to weed cutter which passes under surface and cuts off roots. Then they are raked into small bunches then in time threshed. The ordinary grain thresher will answer for the small varieties, providing part of the teeth are taken from cylinder. For Limas the bean thresher is necessary.

* * *

Douglass Mixture.

Will you let me know where I can obtain some Douglass mixture?—H. F. E., Santa Barbara.

It consists of half a pound of sulphate of iron and one ounce of sulphuric acid dissolved in two gallons of water; and is to be added in the proportion of two tablespoonfuls to each pint of water in the fountain. Whilst the fowls are molting, the above mixture, or a little sulphate of iron, should always be used; it will assist them greatly through this, the most critical period of the whole year; as also does a good pinch of powdered brimstone to each bird (mixed in the soft food) every other day, till the new plumage is nearly complete. With this aid, and a little pepper on their food, with perhaps a little extra meat, there will rarely be any lost at this time. With hardy kinds and good shelter such precautions are scarcely necessary; but they cost little, and have their effect also on the early re-commencemont of laying.

* * *

Itch or Lice.

Have a two-year-old thoroughbred pony slightly affected with itch. Is there any cure? If not, what is a good remedy to keep it from showing?—O. A. D.

Are you sure this is not chicken lice. They are often very bad at this season. If it is chicken lice wash the horse with kerosene emulsion, using three finger widths of kitchen soap dissolved in half gallon of water. Put the can on the stove and boil it until dissolved and whip into it one quart of kerosene until it is a creamy mass. Then add ten times as much warm water and wash the horse all over with it. Be sure the oil is all taken up or the horse will be blistered. Spray the surroundings or whitewash them. Now, if it is regular itch it is hard to be certain what form. Try the use of lard rubbed into the spots and then follow up with flowers of sulphur well rubbed in. Kitchen salty grease with flowers of sulphur is also good. Stop feeding grain and give green stuff if possible.—M. E. S.

* * *

Various Questions.

I wish to ask for: 1—A recipe for curing ripe olives. 2—A recipe for making wine out of green rhubarb or pieplant. 3—Where can I get a good book on bee culture? Is the bee book advertised in the Cultivator the best to be had? 4—Can I sow alfalfa seed this month? I can get the ground in good shape. It was plowed last spring and has lain fallow all summer. 5—Would you advise me to put some nitrate of soda on winter lettuce, turnips and beets? If so, how much per acre?—W. R. G., Auburn.

See page 297 of this issue for the formula on olives.

An agreeable and healthful wine is made from the expressed juice of the garden rhubarb. To each gallon of juice add one gallon of soft water in which seven pounds of brown sugar have been dissolved; fill a keg or barrel with this proportion, leaving the bung out, and keep it filled with sweetened water, as it works over until clear; then bung down or bottle, as you may desire. These stalks will furnish about three-fourths of their weight in juice, or from 1600 to 2000 gallons of wine to each acre of well cultivated plants. Fill the barrels and let them stand until spring, and bottle, as any wine will be better in glass or stone. Another: For every four pounds of the stalks cut fine, pour on one gallons of boiling water, adding four pounds of brown sugar; let stand covered twenty-four hours, having also added a little cinnamon, allspice, cloves and nutmeg, bruised as may be desired for flavoring; then strain and let work a few days and bottle.

The A, B, C and X, Y, Z of Bee Culture is as complete as any.

You can sow alfalfa this month or next.

Mr. Lobinger will answer other question.

* * *

Chicken Fleas.

Chicken fleas bother us to death. What shall we do?—H. S., Burbank.

Fleas or lice are most common in the nests and on the sitting hen, from which they may infest a brood of chickens. When either abound nest

"MAKE GOOD."

If you start to do a thing
Make good;
If it be to dance or sing,
Make good;
If to write a famous book
Or to be a noted crook,
Do your best, by hook or crook,
Make good.

If you have a goal in view,
Make good;
It is simply up to you,
Make good;
Talk is cheap, so cut it out,
If you win the victor's shout
You must watch what you're about,
Make good.

If you make a little bluff,
Make good;
Ante up the promised stuff,
Make good;
Failure everywhere is rife,
Be a live one in the strife,
Do the best you can in life,
Make good.

—Southern Merchant.

"BR'ER RABBIT" AT "UNCLE REMUS."

"BR'ER Rabbit" has taken up his abode at the home of "Uncle Remus," not in spirit, but in the living flesh.

And there lies a remarkable coincidence following the recent death of Joel Chandler Harris.

Just a week to the day had passed, following the last tribute paid the noted author who personified the animals and made the shy but shrewd rabbit stand out in fame among all the rest, when a real live rabbit came to "The Sign of the Wren's Nest," and adopted it as his home.

Where he came from nobody knows; where he was going he decided for himself, for he concluded that the "Snap Bean Farm" was good enough for him. And there he is apparently to stay.

One Sunday morning the butler caught a glimpse of him, and thinking him one of the denizens of the wood who had lost his way and strayed unwittingly into civilization, was about to throw a stone at him. Mrs. Harris saw him in the nick of time and prevented the attack.

And then the children, grandsons and granddaughters of the late "Uncle Remus" resolved they would try to make a pet of him. Cautiously they approached him, food in hand, expecting every minute he would turn and run to escape them, but not so Nearer and nearer they went, but Br'er Rabbit did not stir until the proffered food was placed beneath his nose and then—he ate it.

It was a tame rabbit; there was no doubt of that. But whose? and where did he come from? Diligent inquiry has failed to establish any ownership, and in the meanwhile the unexpected but not unwelcomed visitor has found a congenial abode in the coal shed with a coal pile for his bed. There he goes nightly as he has done since his arrival, venturing forth by day to nibble dainty bits of green, play with the children or chase the cat—a favorite pastime.

Strangely enough, considering Mr. Harris' fondness for the animal tribe, and the rabbit in particular, never before has there been one that claimed a home upon the Snap Bean Farm.

A coincidence is his coming now, but may it not be Br'er Rabbit's tribute from his kind to the memory of a universal friend?—Atlanta Constitution.

RECIPES.

Salads.

What, in your estimation, is the most tempting and appetizing dish for a summer meal? A salad, to be sure. When a hot meal seems impossible, both for the one who must prepare it, and the one who must eat it, a salad is a very God-send, for it may be made with little or no cooking, and its freshness and coolness would tempt the most sluggish appetite.

A good mayonnaise is necessary for a good salad. Below we give a receipe for one of the very best.

Mayonnaise.

Put the yolks of two eggs in a clean, dry soup plate or bowl; stir lightly with a fork; add a quarter of a teaspoon of salt, and then begin to add, almost drop by drop, the salad oil. Time will be saved and the danger of curdling removed if the oil is also made cold. After you have added a gill of oil, begin to add now and then a drop or two of vinegar; in this way, by alternating the oil and vinegar, allowing two tablespoons of vinegar to each pint of oil, the dressing will be smooth and not oily or jelly-like. In jelly like condition it is apt to separate after standing. You may add more or less oil, acording to the quantity of dressing desired. Do not add any great amount of seasoning to the dressing; it is by far better to season the salad, as frequently the addition of more acid or other materials will spoil the consistency of the dressing.

After you have added a pint of oil in the preceding receipe, you may stir in carefully a half pint of cream whipped to a stiff froth. This adds greatly to the bulk of the dressing, and softens down the oil for those who are not fond of the flavor. The cream must be added at the very last moment, just as you are mixing the materials with the dressing.

This is the simplest receipe for mayonnaise. Much stirring is necessary; do not try to make it in a hurry, for then failure is certain. Stir it gently all the time you are adding the oil.

Apple Salad.

This salad is really composed of sliced apples, any nut meats chopped fine and celery, but if you have no celery, the celery salt can be used and serve it on lettuce leaves. At the last minute pour in the mayonnaise and toss lightly with a fork. The oil in the dressing causes the celery or lettuce to wilt.

A Novelty.

Tomatoes hollowed out may be filled with dice of cucumbers, or vice versa, the scooped-out cucumbers filled with dice of tomatoes. An inventive mind can easily find many ways of using these same and other vegetables.

Potato Salad Additions.

To make more attractive the ever useful potato salad, try a different style in dressing. Take a dash of salt and of pepper, one tablespoonful finely cut parsley, one teaspoon grated onion, with two tablespoons olive oil or butter. Mix all with four tablespoons vinegar. Slice one quart of boiled potatoes, not too thick, pour over them the mixture, and let stand an hour. Instead of the onion some like celery, diced or celery seed—a sprinkle. Add sliced cucumbers or hard boiled eggs. All these add va-

FARMERS' BOOKS

Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

riety. Pieces of lemon garnish it well.

Another.

Boil some new potatoes and cut them into small dice till you have two cupfuls; boil some eggs hard, four or more, and cut these up also; sprinkle freely with salt, pepper, oil and vinegar and stand away on ice for an hour without stirring. Then add a cupful of broken English walnut meats, and two dozen stoned—and slightly chopped—olives and a cupful of stiff mayonnaise; do not crush the ingredients in mixing; mask the top with additional mayonnaise and a few olives.

CURING THE BORROWING HABIT.

In a prosperous village in the northwest, a village that had not yet arisen to the dignity of a public baker, there lives a housewife noted for her industry and energy. Her mother was a great bread maker and she (the young housewife) had always, from her girlhood, been accustomed to high-grade homemade bread.

Her mother said there was one great secret to bread baking, knead, knead, knead! The lazy, shiftless, slovenly woman, who threw her mix together any old way and trusted to good luck for the yeast to work through, never made good bread. It was beyond her.

So when this daughter of her mother took to herself a husband and, in turn, bossed her own kitchen, she made bread as mother used to make it. She got the best flour, and there is only one best flour, it wouldn't be best if there were more than one, and the best of everything else and she made bread. The advice of her mother took deep root in her and as far as bread was concerned, she did not propose to sit at her end of the table and listen to her husband prate about bread as mother (his mother) used to bake.

So she kneaded and kneaded and kneaded, and, exercising due care also in other directions, she always took from her oven a batch of light, full-volumed, nut-brown, sweet bread. Women win or lose reputations, and she won a reputation as a bread-maker. And the neighbors began to borrow. The borrowing habit became confirmed and our good and industrious housewife found that, instead of having one baking day, she must bake twice a week to insure bread being in the house.

Of course, the neighbors returned their loves of bread, and such bread! Kneaded with a spoon or stirred in a pail with a poker, but no elbow grease used as shortening. As a rule it was coarse and abominable bread, streaky and lumpy. She wouldn't put such bread on her table, so sitting down she put on her thinking cap.

As Mrs. Jones returned her loan, she would write on a slip of paper, "Mrs. Jones, Her bread," and the loaf would go into the bread tin and there remain one, two or three weeks, until Mrs. Jones got bread-hungry again for a really good slice of homemade and around would come Mrs. Jones' little girl for the loan of a loaf of bread.

So going to the pantry our industrious and intelligent housewife would take Mrs. Jones' own loaf of bread, beautifully stale by this time, and soberly hand same to the observing and somewhat astonished child, and she (the messenger) took back home a loaf of her mother's own bread.

And the borrowers one and all in due course each got back a loaf of their own "stale," and, as a result, the borrowing habit ceased in the neighborhood. The industrious bread-making woman bakes now but once a week, as of yore, and when people come to tea they all praise her beautiful, white, sweet bread and eat bountifully of it, ask for her formula, but never attempt to borrow. The story had traveled around.—Bakers' Review.

TEACH THE CHILD.

To fill the lungs, breathing deeply through the nose, holding the breath an instant and expelling it slowly.

To stand erect with his head well against the collar, and the chest out.

To keep the hands clean

To keep the finger nails clean.

Never to put whistles or toys in their mouths without first washing them.

Never to moisten the finger or thumb when turning papers, handling papers or money.

Never to eat things that are dirty.

Never to eat fruit or candy picked up in the street.

To wash the cup used by others before drinking from it.

To gargle the throat with salt and water before being exposed to disease (One-fourth of a teaspoon of salt to a tumbler of water.)

Never to kiss a sick friend

When coughing, always to turn the head away from a person and hold a handkerchief over the mouth

To clean the teeth morning and night.

To eat slowly.

To chew the food well.

To be cheerful.

To stay in the sunshine and fresh air.

To sleep with the mouth closed.

GET THE RIGHT ONE.

"Sir, I want your daughter's hand."

"You may have it with the greatest pleasure, dear boy, if you'll take the one that's always in my pocket."—Baltimore Sun.

A Goat for the Baby

BY MISS B. A. R. STOCKER OF ARROYO GRANDE.

PROBABLY there is nothing that would lessen the mortality among bottle-fed babies quicker than a more general keeping of milch goats.

These kindly little friends of the infant, the sick and the poor deserve better at our hands than to be made the subject of empty laughter. Isn't it paying too dearly for our joke when because of it the cradle is empty and the light is gone out?

In Switzerland when help is needed to raise a baby one of the family goats is assigned as its foster mother. She readily adopts the infant, will fight in its defense and run to it when it cries.

Even in California a neighbor tells me she has seen a Portuguese goat nursing a baby, or a Portuguese baby nursing a goat, I forget which she said. Take your choice!

Trouble is often experienced in buying milk from one particular cow for a baby; and the manufactured article cannot possibly be as good as the natural. When was ever any canned stuff quite equal to the original? Thousands of families who cannot keep a cow could easily keep a couple of goats and solve the problem. It is a surprise to find how much easier a feeding bottle is kept clean and sweet when goats' milk only is used. In cool weather the milk will keep a week without souring. The cream rises very slowly, thus preserving the milk much longer in its perfect or fresh state. This makes it much more digestible. Also there are seven parts cream in goats' milk as against four in cows' milk.

Finally, it comes cheaper to keep a few goats than to buy milk, and it is incomparably better.

Neglected, half-starved goats may be scavengers, and some of the things repeated against them may be true. But a good goat, properly cared for, is very clean and particular. She will detect a taint where we notice nothing, and will refuse any food that is stale or soiled. Goats' milk will not transmit disease to a child as cows' milk too often does.

Recently I was trying to raise a kid whose mother was dead. My other goat was not giving enough for him and me both, so I bought a little cow's milk, and we divided up. I watched to see if it seemed to disagree with him in any way, but saw no sign. The week before he gained six pounds in seven days. The week after we began the cow's milk he only gained three. Then for three days he gained nothing, and the fourth day he was dead. When opened the little stomach was found packed with old hard curd, layer behind layer. I suppose he never got away with the cow's milk from the very first.

How many a human infant not more robust than he suffers in a similar way. And the end is very swift and totally unnecessary!

The Produce Markets

Los Angeles Markets

LOS ANGELES Sept. 23 1908.

Butter.

Butter has advanced another 2½ cents this week. Sales of extra are very light however at this time and the market is very quiet. The principal demand at this time seems to be for cooking.

Hay.

In spite of bearish reports hay has advanced in price, at least some of choicer grades have.

Somers & Co. say:

In spite of the holiday season which disturbed operations throughout the country early in the week, shipments of hay during the week ending today have increased somewhat over the arrivals of the past week, the total showing 3820 tons in comparison with 3680. The market presents no new or interesting features, for with the exception of alfalfa and straw, which are dragging a bit, prices on all lines seem to be well maintained. Fancy grades of wheat hay are in rather light supply comparatively speaking, so the high range on this particular kind of hay can be moved up a trifle. Medium grades show no strength, however, and taken as a whole the situation is rather weak than otherwise.

Citrus Market

LOS ANGELES, Sept. 23, 1908.

The condition of the orange market is more satisfactory—no great advance in prices but a much firmer tone and quicker sales. About 125 cars remain of the Valencias and these will all be cleaned up before Nov. 1.

Lemons are going forward at about the rate of ten cars per day and at good prices. In fact prices are considerably better than last week.

Shipments.

Shipments of Citrus fruits since Nov. 1 1907 aggregate 28,778 of which 4534 were lemons. To same date last season, 27191 of which 3293 were lemons.

NEW YORK, Sept. 21.—Eight cars of Valencias and three mixed cars sold. There is a good demand for good quality Valencias, but the market is dull and lower on ordinary stock. Grapefruit is very strong. Weather warm and cloudy.

Ticks—Fleas.

Continued from page 307.

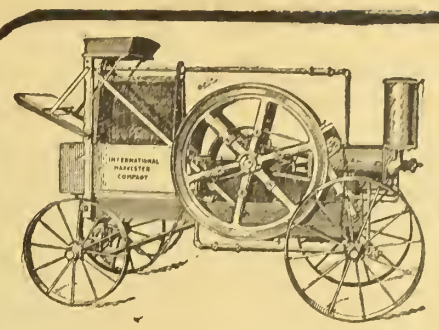
material should be frequently changed, and wild ferns or bracken, if it can be obtained, will be found much less infested by them than straw. The birds themselves should be treated individually, a mixture of two parts buhack (or powder bearing any other name,) and one part powdered sulphur, being well rubbed into the plumage. The heads should be touched with carbolized oil, or oil with a little kerosene in it, which can be slightly applied under the wings. A French paper states that these pests may be kept away from nests by blowing out an egg through holes in the two ends, and placing therein some eucalyptus oil. This is done by cutting a few long narrow strips of sponge, moistening them with water, and then rolling them tightly and closely with twine from end to end. When dry, the twine is unwound, the sponge retains its shape, and can be passed endwise through the hole into the shell. Eucalyptus oil is then dropped in to saturate the sponge, the holes are sealed up with wax, and the oil exhales through the shell.

The house should be thoroughly sprayed with distillate or a very strong distillate emulsion. Later whitewash.

California Cultivator:

There are still people left who think it is wicked to play billiards or pool, because there is gambling done in many Billiard Halls. But they are fast dying out or being converted; for the wrong of gambling is in the gambler and not in the game. It isn't a sin to have red hair just because a couple of men bet on the number of red-haired girls they will meet, is it; and who would throw out his piano because it is an instrument used in disreputable houses?

As a matter of fact there are no games on earth that are cleaner, more innocent than Billiards and Pool. They are truly games of skill; there is not a particle of chance in them, which cannot be said of the parlor games sunday-school children play.



Are solving the hired help problem for hundreds of farmers.

Vertical Engines made in 2 and 3-Horse Power.
Horizontal Engines (Portable and Stationary) made in 4, 6, 8, 10, 12, 15 and 20-Horse Power.
Air Cooled Engines, 1-Horse Power.
Traction Engines, 10, 12, 15 and 20-Horse Power.
Also sawing, spraying and pumping outfits.

I·H·C GASOLINE ENGINES

YOU offer high wages, and still find it difficult to get hired men. Why not do as other progressive farmers are doing—let one of the dependable and ever ready I. H. C. gasoline engines be your hired man?

Suppose you want to grind feed, pump water, operate the churn, grindstone, fanning mill, separator, bone cutter, or saw wood. With an I. H. C. engine you will need no extra help. You can run the engine and attend to the machine yourself.

In the same way it can be used too for irrigating—pumping from wells, lakes, ponds and running streams. The operator can handle the head of water in the field and also attend to the engine.

The engine will work for you indoors or out, in wet or dry, hot or cold weather. You will have no difficulty in operating or controlling it.

Only a few cents per hour is required for fuel. All I. H. C. engines use either gas, gasoline or denatured alcohol.

Please notice in the above list of styles and sizes that there is an I. H. C. gasoline engine adapted to practically every farm requirement.

You can have a small engine which you can easily move from place to place, as your work requires, or you can have a larger engine for stationary use. The efficiency of all I. H. C. engines is well known. You cannot possibly have any better guarantee of a dependable engine than one of these engines affords.

Call on the International local agent for catalogs, and inspect these engines. Write nearest branch house for colored hanger and booklet on "Development of Power."

WESTERN GENERAL AGENCIES: Denver, Colo., Portland, Ore., Salt Lake City, Utah, Helena, Mont., Spokane, Wash., San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY OF AMERICA, Chicago, U.S.A.
(Incorporated)

Nothing is better for man or woman, boy or girl; it combines a gentle physical exercise with the exercise of the highest skill, developing a steady hand and a trained eye like nothing else can. A home with a Billard Table is more of a home than it would otherwise be, and nothing is more productive of good morals, family happiness, success in life than to have the home life as attractive as possible.

Secretary of the Treasury Leslie M. Shaw undoubtedly had this in mind when he said "Install the boy in your home and keep him home as much as possible. Has he a penchant for Billiards? Get him a table, even if it be a miniature one. The more hours each day your son spends at home the more and sooner he develops a clean, healthy, social temperament."

Of course the regulation Table, which weighs a ton, costs a fortune and needs a special room is out of the question except in the houses of the very rich. That is why my portable Tables are selling so rapidly, for they may be used in any room, and are made in so great a variety of styles, sizes and prices that they are within the reach of all.—C. Ridderhof, Laughlin Bldg., Los Angeles Cal.

I saw a woman in a street car open a satchel and take out a purse, take out a dime and close the purse, open the satchel and put in the purse and close the satchel. Then she gave the dime to the conductor and took a nickle in exchange. Then she opened the satchel and took out the purse, closed the satchel and opened the purse, put in the nickle and closed the purse, opened the satchel and put in the purse, closed the satchel and fastened both ends. Then she felt to see if her hair was right and she was all right. This was a woman.—Green's Fruit Grower.

A WORD FROM JOSH WISE.

"Men sneer at women's shoppin', but when women shop they don't have ter eat cloves to disguise what they've been buyin'."—McAlester Daily Capital.

A fruit grower of Benton county, Oregon, having a 19 acre ranch in the famous Willamette valley was recently offered $15,000 for 19 acres. This is said to be the highest offer for fruit land yet made in Oregon.

A 10 YEAR ROOFING GUARANTEE.

In the advertising columns of this paper the United Roofing and Manufacturing Co. are offering to every purchaser of 3-ply Congo Roofing a National Surety Co. guarantee bond, which covers a period of 10 years. This Company is one of the largest Surety Companies in the world, (capital and assets of about $2,000,000) and when they back a proposition there must be a great deal in it or they would not have risked their reputation on something about which there could be any question.

The Congo people are desirous of making this roofing the most used in the world, and with their usual foresight hit upon this excellent plan of giving the buyer satisfaction as well as increasing their sales. The bond is a plain statement of what they can and will do, and offers such protection that no prospective buyer can afford to overlook. This bond means protection to you.

It isn't necessary to buy the roofing to learn the contents of the bond—which is another pleasant feature. By writing to the United Roofing & Manufacturing Co., Philadelphia, Pa., they will be glad to send you information regarding same and sample free.

WHAT THE GROUND CONTAINS

is a question which many farmers have tried to answer. Its treasures of minerals and of pure water should be revealed by the use of "American" Drilling Machinery. Every neighborhood should organize a company and by working together and sharing the prifits and advantages wherever found, great additions to wealth of the community as well as the individuals would result. Any of our readers who are interested in this question should write for the new illustrated drilling catalog of the American Well Works, Aurora, Ill.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Free on board cars at Los Angeles. Live agents wanted in every county.

Protecting Fruits from Damage by Frost

Suggestions From a Weather Bureau Bulletin Which May Be of Value to Fruit Growers During the Next Few Months

THE PROBLEM of protection from frost may be considered under four sections, as follows:

1. The issuance of adequate frost warnings.

2. A discussion of the physical processes operative in the formation and dissipation of frost.

3. The construction of devices and apparatus based upon the principles enumerated in No. 2.

4. The intelligent use of these devices so that a maximum efficiency may be obtained at the critical hour.

In California frosts are found to occur under certain pressure conditions. A period of strong north winds followed by clear skies is a period of danger. Frost is essentially a problem in air drainage and some knowledge of the movement of the air over the ground, or in other words, the local air circulation, is essential for successful frost forecasting. The chief cause of cooling is undoubtedly radiation, and this is controlled to a large degree by the relative purity and stillness of the air. When, therefore, the lower air strata are quiet and dust free, also vapor free, conditions are favorable for intense radiation; and consequently rapid cooling of both vegetable fibre and the soil. All fruit growers should carefully study the weather conditions preceding frost in their localities. The district forecaster at San Francisco and observers at any Weather Bureau station will gladly receive suggestions in the matter of local air drainage and frost formation and will, so far as their time permits, investigate and report upon local features.

Under the second heading, discussion of the physical processes involved in frost formation, we would call attention to the following ways of preventing the fall in temperature:

1. Adding heat.
2. Adding water vapor.
3. Adding both heat and water vapor.
4. Ventilation, or mixing of the air.
5. Irrigation, or use of water.
6. Use of heated water.
7. Use of screens or covers, preventing loss of heat by radiation.
8. Spraying.

All of the above processes can be found explained in detail in publications of the Weather Bureau. The action of water in any of its forms; whether solid, as ice or frost; fluid, as water; or gaseous, as water vapor, is protective. Large amounts of heat are given off in the change from vapor and from liquid to solid. Theoretically, it is possible by the application of sufficient water to prevent injury by frost. As the plant cools, owing to radiation and an indraft of cold air, the vapor present condenses, giving free a large quantity of heat, something like 600 calories; and if the water turns to frost, more heat is set free, about 800 calories. If, for example, in an ordinary rain gaage enough frost has formed to weigh, when melted, about an ounce, then the latent heat of condensation is approximately 908 times 680, or 617,440 calories, enough to raise the temperature of the air at freezing 4 degrees over a space of 10 feet square and to a considerable height.

Note also that the water plays an important part when the sun rises and the warming of the vegetable fibre begins. Here the water retards the heating, and is thus very beneficial. Chilled plants sprayed with cold water about sunrise are less liable to injury. The latent heat of evaporation and fusion now comes into action in an opposite direction, the heat being utilized in changing the frost into water or the water into vapor. This, in the writer's opinion, is the critical period, and he believes that more injury results from the too rapid warming of plant fibre after it has been chilled than from the chilling itself. He has known of cases where delicate flowers have been incased in ice and yet no injury resulted, largely because the thawing out was gradual. In examing many orchards it has been ascertained that the portion most exposed to the sun's heat in the morning is, other things being equal, the portion of greatest injury. Up to the present time the chief effort in frost protection has been to prevent loss of heat by radiation from the ground; and protective methods have been rightly based upon the possible saving and storage of heat. But it may be none the less profitable to study the problem from a later stage, namely, the period of the chilled fibre. While it is not definitely known what action during frost causes the death of the cell tissues, whether it be a rupture of cell walls or a separation and withdrawal of water content, it would seem that we could not err in guarding the plant fibre from any strain due to rapid and unequal heating when in a chilled condition. Beginning before sunrise, some screen or covering should be intersposed between the fruit and the sun's rays. For the reasons given above it is also advisable to apply water. It may interest fruit growers to point out to them that the actual temperature of the air is probably of less importance in frost formation than the cooling of the plant surface due to radiation. Nearly all fruit growers now understand that after sunset, if there be no clouds present and but little motion of the air (though it is well to test this by watching the flow of smoke near the ground) the plant surface emits heat rapidly into space. The under surface of the foliage, of course, intercepts heat from the ground, and so we seldom find frost forming under a tree. The convective currents of the air are generally sluggish and there is, as a rule, little mixing of the air strata, or no thorough circulation at such times. Helmholtz has shown that layers of air of different temperatures may lie close to one another without mixing, and indeed this is known to be the case not only near the ground but even in free air. Doubtless herein lies the explanation of the streakiness of frost. We have examined orchards which were apparently level; and yet upon close inspection it was found that although there was no noticeable slope of the ground, there were certain channels of air motion and certain stagnant zones. The frost streaks were found to coincide with the stagnant areas. Much, however, depends upon the nature of the radiating surface.

The warming or the chilling of the ground has not much effect upon the air at a distance of 10 or 12 feet. That is to say, the rate of heat conduction from one layer to another is very slow. Therefore, it is not unusual on frosty nights to obtain readings of 32 degrees F. at the ground, while at 6 to 10 feet above the ground the temperature may be 36 degrees or 38 degrees F.

Under the third head, viz., the construction of devices and appratus for use in orchards, vineyards, gardens, etc., we believe that each local forecaster can contribute materially to successful work by examing in situ any device brought to his notice. It is suggested that he read up the history of the wire coal baskets, first used by Edward Copely at Riverside, California; the use of oil by Everett at Arlington; the application of hot water, first used by Meacham; the smudge machines of Hall, Hammond and others; the oil pots; and the small, cheap, sheetiron stoves in which briquettes are burned and which are now on the market. The methods of protection by covering, whether cloth or lath, should be looked into. The question of expense will determine the availability of the method. In California the diversity of interest is so great that no general recommendation can be given, and in each locality the local forecaster should fit the method to the fruit. In the Riversire, Redlands, Colton section the orange naturally claims first attention; at San Diego, both lemons and oranges; in the foothills of the San Joaquin, oranges; in the valleys, the raisin vines in the spring; in the Sacramento valley, the garden truck; in the Bay valleys, the almonds against the late spring frosts; and in Northern California, the deciduous fruits. In all directions there is room for improvement. And not only in the construction of apparatus, but in the manner of application. Particularly valuable are cases where apparently effective devices fail to accomplish the desired protection. Such cases should be studied and the reason for the failure ascertained. This constitutes progress.

Under the fourth heading—the use of our knowledge so that a maximum good may result—much of what has been said above is applicable. As an illustration, we may instance the case of a large number of fruit growers in a certain section working together. The result was success, where individual effort previously had not been altogether successful. Study your community, as well as the physical problem or the efficiency of the machine.

"Irrigation and drainage, the one putting water where it is needed, the other removing it from where it is superfluous, will add great wealth to the country as time passes. Five million acres of land, provided with water, will be ready for settlement in 1908. The settlers on this land, many of whom will have no knowledge of irrigation forming, may make mistakes at first, but their ultimate success is beyond doubt. If all of this new area came under cultivation at once the crops, plus those now produced on irrigated land, would be worth at present prices $250,000,000. It is believed that even in the East irrigation as a kind of crop insurance will be valuable, and better knowledge of its possibilities will no doubt lead to an extension of the practice throughout some regions where the rainfall is sufficient under usual conditions."—[James Wilson, Secretary of Agriculture.

A parcel can now be mailed from any post office in the United States to any post office in Bolivia, a distance of 4000 miles, for twelve cents a pound. The domestic parcels rate in this country is sixteen cents a pound. Congress ought to explain why foreigners are allowed this advantage in the mails. It has become a glaring case of neglected home interests.

Device for Covering Fumigation Generators

By R. S. Woglum and Frederick Maskew of the Bureau of Entomology of U. S. Dep't. of Agriculture.

FOR several months the force in charge of this investigation has been at work on a device by means of which to interrupt the direct rise of hydrocyanic acid gas from the open style of fumigation generator. The result of these efforts is given herewith.

The device itself consists of a copper cover of such size as to make it available for use with any of the regular pattern of generators now employed by the fumigators of Southern California. Stamped in a concave form from a sheet of copper, with corrugations to permit the escape of gas, the natural lines not only conform to the size of the opening of the generators of different capacities but also direct the course of the escaping gas downward and distribute uniformly throughout the lower part of the tent. Attached by hinges of stout copper wire which are secured by a key-bolt passing through the handle it is self-contained, no parts to lose

Raised by a slight pressure of the

thumb on a projection which is curved in such a manner as to insure the cover remaining in an upright position when so required and swinging clear by its own weight when the generator is emptied of its contents, its use has shown it to be simple, strong and durable. A glance at the illustration will satisfy the practical fumigator that it is adapted to all the requirements of rapid work in the dark.

Advantages of Such a Generator Cover.

When heavy dosages or fine cyanide are used a common resulting effect is the burning and ultimate dropping of many leaves or fruit if present, directly above the generator and which happened to be in the pathway of the rapidly rising concentrated stream of gaseous matter. This result is usually spoken of as "chimney" effect. The generator cover elimates this "chimney" burning.

Saves the Tent.

A second and highly important point is the effect of these open generations on the tent. The outer part, or skirts as they are sometimes called, of fumigating tents are constantly being perforated with small holes, even with the most careful of workers. We have noticed this effect to some extent in our own outfit, than which we believe no fumigation outfit could be more carefully handled . These holes from their nature are known to be acid burns. A few simple tests which we have tried have demonstrated to us conclusively that many of these acid holes are due to acid carried along with the generations of gas and which reaches that part of the tent nearest the generator. We have found acid drops to be carried as much as five feet above the ground in open generations.

In field work the generators are frequently placed as close as two feet to the edge of the tent. This new device so deflects the gas and incidentally such acid as is carried with it, that the drops of material are thrown to the ground, thus saving the tents. The decreased cost in mending of tents will doubtless pay for the cost of such a cover-device several times over in a season of fumigation

Better Distributions.

A third point which we have not as yet demonstrated but which we have reason to believe might result from experimentation is a better distribution of gas through the tent. At present the most difficult part of the tree in which to destroy insects is the lower part. This is also the part of the tree in which purple scale is largely to be found. With the open generation the gas rises straight up in a narrow column for several feet, being broken up and distributed through the top of the tree first. As the gas is lighter than air we would not expect that it would almost immediately become uniformly distributed through the bottom of the tent, even if at any time it becomes as concentrated here as at the top, The greater burning effect, and better killing effect in the top of the tree would tend to substantiate this assumption.

Field observations in fumigating large trees show that the gas is of no great strength at the lower part of the tent for several moments after the charge is set off. With this new style cover the gas is broken up and distributed through the bottom of the tent first. By the time it reaches the top it is pretty generally distributed throughout the tent. As the bottom of the tree is among the first to receive the full benefit of the gas we would be led to expect as complete a killing of scale at the bottom, if not better than in an open generation.

HISTORY OF FERTILIZING.

IT WOULD be impossible to say who first observed the difference between the growth of wheat in places where the cattle had rested and other parts of the field, but we may safely say that whoever it was, he knew not the reason why.

Aristoteles, 300 B.C., advanced a soil theory in which he compared plants with animals, calling the soil the digestive organ of the plants. This theory was not seriously disputed until 1600 A.D., when Von Helmont advanced his water theory. He dried a certain amount of earth and weighed it, after which he weighed a cutting of willow and planted it in a tub in the weighed soil. He watered the soil every day for five years and the willow grew and became a large tree. He then weighed the tree and again weighed the soil and found that while the tree had greatly increased in weight the soil had lost but very little. From which he concluded that the willow had derived its food from the water.

Those were the times of alchemists, and very few were thinking of anything so insignificant as plants, when seemingly the making of gold was just within their grasp. It was not until 1774 that the first step was taken in the right direction. At that date Priestley discovered the first chemical element, oxygen, and in some experiments with plants under glass he found that plants could live in air which was poisonous to animals. He did not know that the cause was carbon dioxide, but he thought that whatever it was it must be a plant food.

We see that the theories ran the whole gamut through soil, water and

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.

air, which last theory was further developed by other investigators, but it was not fully described until 1840, when De Saussure published the results of his investigations. About that time the humus theory started, viz.: that plants live on organic materials and water. It was soon found that the theory was not tenable because of the inorganic salts in the ashes left after burning the plants. This, however, was explained by the disciples of the humus theory, who said that the ash was merely a by-product from the splitting up of organic materials and was caused by some force which they called "vital power."

From this humus theory came the "nature philosophic humus theory" and the "improved humus theory," both of which, although they were disproved, greatly helped to develop the general knowledge of the subject.

The works of Boussingault, commencing about 1830, brought out the next great step in plant nutrition. He demonstrated that certain plants could utilize the nitrogen of the air and that certain other plants could not. This was also demonstrated by Laws and Gilbert, whose works are rather better known in America. There were, of course, many other investigators in the first half of the nineteenth century, and a great deal was written which had more or less direct bearing on plant nutrition, but the subject was in more or less of a chaos until Justus Von Liebig published the results of his investigations and conclusions drawn from investigations of others.

After the discovery of oxygen, other elements were discovered and it became possible to analyze the air, the water and the soil, as well as the plant, and as all the investigators were chemists, the question of plant nutrition was naturally studied from a chemical standpoint. It was found by analysis that plants contained oxygen, hydrogen, nitrogen, potassium, carbon, silicon, sulphur, phosphorus, chlorine, sodium, calcium, magnesium, aluminum and iron, together with a small amount of many other elements not directly necessary for the majority of cultivated plants. The air was found to contain oxygen, hydrogen and carbon, which could be utilized by all plants, and nitrogen which could be utilized by plants of the bean and pea family. Soils were analyzed, and by comparing plant and soil analysis it was soon found that all soil contained enough silicon, sulphur, chlorine, sodium, aluminum and iron, and most soils enough magnesium and calcium, for normal development of the average cultivated plant. Many old cultivated soils were found to be deficient in potassium, phosphorus and nitrogen, while some were apparently inexhaustible. Water was found to contain oxygen and hydrogen, which could be utilized by the plant, besides water being a necessary solvent for all other nutrients.

After a time it became apparent that questions other than chemistry were involved. The chemical analysis showed that certain elements were present in the plant, but it did not explain the process by which those elements were transformed from an inorganic to an organic form, much less the process by which these inorganic, inanimate elements could form a live plant.

It is true that some of the investigators were physiologists as well as chemists, but plant physiology proper is of a comparatively recent date, and more recently we have the physiological chemist, who covers the field still more thoroughly.

Although it can now be explained in a fairly comprehensible manner how plants feed, there are still many questions unsolved. We know that plants absorb through the roots, mineral substances held in solution by water, and through the leaves, carbon dioxide from the air. The process of building up plant tissue from these substances we explain to be, in short, a decomposition of water and carbon dioxide by which the inorganic salts are changed into organic compounds. We know that the process is not a purely chemical one and we know that light is necessary and we therefore explain that the process is by virtue of energy derived from light. After all, not much of an advancement from "vital force" of the humus theory. Nevertheless we know a great deal more than those who advanced the humus theory, and the practical farmer cannot afford to call the scientist a crank because he cannot explain it all.

There are other factors connected with the question which, although they are outside the plant, are of no less importance than those just discussed.

We know that we can grow a plant in pure sand or glass powder provided we supply foods and water and expose the plant to suitable temperature and light, but while this is possible it is not practicable. It is true that the soil is a matrix for storing plant food and for the formation of plant roots, but it is more than this. A soil without humus and without soil bacteria is unprofitable from an agricultural standpoint and such soil must be built up.

Soil building has been one of the great economic questions in Europe for the last forty to fifty years. In the latter period of the humus theory and until recently, the earth worm was described as a factor in soil building. The soil might be dry and poor and physically unfit for plant growth, and even earth worms could not live in it. After plowing under a crop of grass or some other plant and cultivating it a few times, making it hold moisture better, the earth worm would start work, carrying plant material down into the soil and thereby mixing and aërating it. After a time the soil, whether sand or clay, would have changed into loam and the earth worm was given the credit. There is no question but that the earth worm does this work and of course it needs no argument to prove that it is beneficial, but we now know that soil bacteria are the real beneficial agents. A dry uncultivated soil, poor in humus, is dead, agriculturally speaking, but with some humus, moisture and air the various bacteria start work and we term the soil as having "life in it." Of the various basteria, the ones connected with nitrogen assimilation are best known, and most farmers know that the leguminous plants are able to utilize the nitrogen of the air through the aid of a bacterium. The one which transforms ammonia into nitrogen is of no less importance in this discussion, and as we know of bacteria that act on sulphur and iron compounds, we may expect to find some that act on other minerals also, and it is not improbable that bacteriology will be as much of a factor in plant nutrition as chemistry and physiology.

To sum up the matter, we find that the only chemical elements entering into the question of plant nutrition, as far as the farmer is concerned, are nitrogen, potassium and phosphorus.

We also find that we have physical factors to deal with involving air, light, moisture, etc., as well as bacteriological, embracing questions of soil and tillage which are of vital interest to all agriculturists.—[Porto Rico Horticultural News.

"LEST WE FORGET."

Editor California Cultivator:

I heartily endorse the remarks of S. A. Connor in the Cultivator of September 17th, condemning the foul attack upon the memory of the late B. M. Lelong. He may have had his faults—who has not?—but the fruit growers of California do not forget his abounding energy and the enthusiasm he always inspired in whatever pertained to the welfare of California horticulture. Nor do we forget the work that was accomplished from year to year, under B. M. Lelong's secretaryship with the Hon. Ellwood Cooper as president. Look up the reports and bulletins that were published over a period of thirty years or more, and form some idea then of what has been done. Those of us who have been associated with the Horticultural Commission during all those years—not officially—repudiate with indignation the aspersions cast not only upon the memory of one who has gone, but upon the work of the Commission and its honored president. —Leonard Coates, Morganhill, Sept. 19th., 1908.

FANCHER CREEK NURSERIES INC.

Geo. C. Roeding Pres. & Mgr.

Box 12 Fresno, California, USA

Do you want a

Ranch Superintendent?

A first class man with 18 years practical experience in California horticultural work, capable of taking charge of a large Citrus or Deciduous Orchard, a Nursery or Nursery Work, well acquainted with all the details of irrigation, fertilization, cultivation, budding and pruning of trees, etc., wishes a position as superintendent of some large fruit ranch. First class references. Would go in partnership with some one with means in establishing such a ranch in Southern California or Old Mexico. Address, "Superintendent," care Cultivator Office, Los Angeles, California.

An apple grower of Dayton, Washington, will secure $50,000 worth of apples from 100 acres.

Deciduous Fruit Culture

OIL EMULSIONS.

COUNTY Entomologist Earl Morris of Santa Clara county recently read the following at the County Entomologists, meeting at Watsonville.

"The work of oil emulsions in the Santa Clara Valley has not been carried to completion, therefore the statements made now may be somewhat modified later. Our conditions are rather simple because all our fruit trees of economic importance are deciduous and for all the purposes for which we have so far wished to use the oil the application is best made in the winter while the trees are dormant. There is, therefore, no possibility of injury to foliage and little danger of bud injury. We have not found it necessary to make fine distinctions among the grades of oil. There is considerable margin between the amount of oil which will injure the buds and the amount necessary to kill the insects which gives plenty of room to work for cheap effective non-injurious oil emulsions.

Common Distillate.

We have use for both distillate and crude oil. The ordinary 28 per cent Beaume stove distillate is cheaper than the so-called tree distillate and so far as we have been able to determine just as effective as an insecticide. It is very effective against brown apricot and black scale. An 8 per cent solution, that is 8 gallons of oil, not counting the emulsifier, to 100 gallons of spraying material, will kill practically 100 per cent of either the brown apricot or black scale without any apparent injury to the buds. If the application is delayed until spring just before the buds open there is no more danger than in the winter, possibly not as much, since the internal pressure on the cell walls is increasing and may resist the penetrating power of the oil. Thoroughness of application is very essential to insure success as every insect must be wet by the spray.

If the orchardist knows the scale when he sees them and knows by actual observation the parts of the tree to which they are attached it will do more to enable him to apply the spray properly than would the reading of forty printed pages of instructions

PACKING CHERRIES IN SAN JOAQUIN VALLEY.

The insects are very small during the winter and are very different looking creatures from the adults of early summer. They are generally found on the underside of the tips of the limbs, that is, on the growth of the previous season. No other parts of the tree are harder to reach by the spray than these, especially toward the top, but with a little care we get excellent results.

Italian Pear Scale.

We use crude oil emulsions for the Italian pear scale (Epidiaspis piricola). This insect has the habit of concealing itself under the lichen or moss which is abundant on our trees. It is necessary for successful control either to penetrate the moss with the spray or to kill the moss wait until it falls or is removed from the tree and then make another application. In fact we do not know of any material which will at one application penetrate thick, heavy moss and kill the scale satisfactorily The writer has succeeded in making one application do the work under such conditions, but he is confident that the degree of thoroughness of application required would not be practical on a large scale.

Crude oil kills the lichen and penetrates it very satisfactorily, at the same time forming a thick, heavy coating which may serve to smother the scale. Be that as it may, the scale die and we are well satisfied with the results.

The lime-sulphur sprays also give good results with this insect but do not exceed in efficiency the crude oil and are more expensive. The distillate has not given satisfaction so far. Experiments seem to indicate that the crude oil will be effective also against the brown apricot and black scale. It will probably never take the place of distillate for these scale alone, because it is new, unpleasant to handle, but when they are with the Italian pear scale it gives promise of usefulness.

It has been suggested that crude oil may be injurious if applied too often. Our orchards must answer this. We have prune orchards which have been sprayed for five or six consecutive years with crude oil. They were badly infested with the Italian pear scale when the spraying began and now they are practically free from scale and in good growing condition.

Essential Thing.

For making oil emulsions the essential thing is a good emulsifier—a good soap we may call it—to make the oil mix with water. Given a power sprayer and machinery for vigorous agitation distillate may be mixed with water without the use of soap, but crude oil is too heavy. There are many ways of making emulsifiers and we usuallly get as many different emulsions as we have emulsifiers. Some of these emulsions are satisfactory and some are decidedly unsatisfactory. It is annoying in the extreme to find that we have put oil on some of our trees and water on others. The best emulsifier we have found may be prepared in the field as follows:

Place in an iron kettle 2 parts crude carbolic acid, 2½ parts fish oil, one pound caustic soda to every gallon of liquid. Have the caustic rather finely pulverized. Heat the mixture to 300 degrees F. Then add 3½ parts of kerosene and after it has cooled enough not to generate too much steam add 5½ parts of water. Do this in the open away from buildings, as there is some danger of fire. This preparation does not require prolonged heating, is quickly and easily made and does not have to be reheated when used. It costs less than 20 cents the gallon. One gallon will emulsify 10 or 12 gallons of crude oil or 5 or 6 gallons of distillate. One hundred

ACTION AGAINST PEAR THRIPS.

THE pear thrips, which by the way is not confined to pears by any means, but which is at the present time one of the worst of our peach, prune and plum pests, has done infinite injury in the Santa Clara valley and other sections in which it has a foothold. It seems to be spreading rapidly, as it is reported from new sections every season. This pest does its destructive work on the blossoms of the fruit, destroying the vital parts, or so badly injuring them that the fruit is deformed and worthless. The Department of Agriculture, through Dr. L. O. Howard, Chief of the Entomological Bureau, has undertaken a thorough investigation into the work of this pest with a view to discovering some means of checking it. Dr. Howard has been in the State for some days past giving the work his personal supervision, and he assures us that no effort on the part of his bureau will be spared to give our growers relief. California owes much to the Department of Agriculture, for it has ever been willing to extend us aid in all lines whenever it has been called upon.

COLONIZING THE NORTHERN COUNTIES.

Attention is now being directed to sections of Central and Northern California as points for settlement. There is a steady stream of population setting toward California, and this has been increasing as the years have passed, and there is yet no abatement to it, and very many sections which have lain unnoticed are now coming into prominence. Among other big schemes is one for colonizing 5000 acres near Delano in Kern county. This is under the direction of John Hayes Hammond, the world known engineer and is already well under way. Several sections of this tract are being set out in experimental orchards to illustrate what the land is capable of, and it is to be sold out in small orchards which will be cultivated under contract for the purchasers, until they may be ready to occupy their individual holdings. Another large scheme along similar lines is being carried on in Butte Valley in Siskiyou county. This section is well up in the mountains, and only the more hardy vegetation will do well here. It is being extensively advertised in the east and colonies are being formed there to settle it.

IS THE CODLING MOTH DISAPPEARING?

For the past three years there seems to have been a gradual lessening of the quantity of codling moths in the apple sections and a great reduction in the damage done by them. We have received letters from apple growers whose orchards were infested by this pest a few years ago and who now state that it is hard to find a single wormy apple. In many sections the percentage of wormy fruit is reported as much smaller than usual, while in some it is reported bad as ever. On the whole, however, there appears to be a great reduction in the damage done by this pest and we are justified in hoping that some natural cause is lessening its numbers. Last year it was thought that climatic conditions had something to do with it, but these conditions have been different this year and yet it is said to be decreasing. It is often the case that pests will be overtaken by their natural checks, as the San Jose scale in our State has been, and it is sincerely to be hoped that this worst of our apple pests has been over taken by its Nemesis at last.

GROWING TABLE GRAPES BY WHOLESALE.

The very large profits made from the Tokay grape in the past few years has turned great attention to this fruit and there has been a considerable sized boom developed in that part of the State where it does best. Probably the largest single body of table grapes in the world is to be found in Sacramento county, where an eastern company has 1100 acres which was started in 1905 and is now practically all under cultivation. During the present season there were shipped from this vineyard 15,000 crates which each brought on an average $2.50 per crate in the eastern market. The whole of this great vineyard is irrigated by water pumped from wells.

PEACHES ARE STILL POPULAR.

We are informed by several of our leading nurserymen that the demand for peach stock for winter planting promises to be as heavy this season as it has been each season for four or five years past. The spread and destruction wrought by the San Jose scale in the east has very materially checked planting there, while numbers of the old orchards have been killed out by this pest. Conditions in California are much better, for peach growing, and the demand for our fruit is not likely to decrease. The principal varieties called for are the canning kinds, and it is largely the demand of the canneries which keep up the peach boom. As there will in all probability be a steady demand for California canned peaches there is not likely to be any let-up in planting for some time.

CALIFORNIA PROSPEROUS.

There was a financial stringency in the east a year ago but California hardly realized it, while this year may be accounted by farmers of our State, as among the most prosperous in our history. Crops, as a rule, have been good, the demand for our products excellent and prices satisfactory. Our agricultural population on the whole have done well, and the country banks are well supplied with money from the deposits of the farmers, while the purchasing power of this important class is greater than ever. It is a fact, that when the farmer is prosperous everbody is prosperous, so we may consider the present a prosperous year for the whole State. It is probably a fact that the farmers of California are better off as a class than are those of any other State in the Union. We may mark up the present as another prosperous year for California and begin to make preparations for a better one next year.

SPRAY FOR PEACH BLIGHT.

Owing, probably, to the very dry weather of last spring, there was comparatively little peach blight reported this season, but it will not do for growers to assume that, because it was checked this year, it has disappeared. In all those sections where it is prevalent, it will appear again in force as soon as conditions are again favorable for it, and it will be well to take precautionary measures against it. A thorough and early spraying of the trees with the Bordeaux mixture, winter strength, is to be recommended. This should be attended to as early in the season as possible, as the longer this work is left the less effective it is.

Made of Trinidad Lake Asphalt—

Genasco Ready Roofing

Does what roofing ought to do—gives you absolute weather-protection all the year 'round. Outlives every other ready roofing. Doesn't dry-out, rot, crack, or break.

Keeps out heat and cold. Resists fire. Is proof against lightning. Can be laid on any surface; and by any handy man. Cement and nails in every roll.

Ask your dealer for Genasco. Mineral and smooth surface. Look for the hemisphere trade-mark. Write for Book 35 and samples, free.

WISS ORANGE CLIPPERS

Will Not Bruise the Fruit

Indorsed by the United States Government Experts and by the leading citrus growers.
Recognized as the most practical clipper.
Made of the very finest material by expert workmen.
The blades are perfectly tempered and specially curved.
Handles are correctly shaped and will not tire the hand.
Every pair absolutely guaranteed.

WISS Solid Steel Pruning Shears will snip a Broom Handle and cut the most delicate tendrils. All parts interchangeable. Any broken part can be readily replaced. 9-inch size, $2.25.

For Sale by all first class Dealers

J. WISS & SONS CO., Littleton Ave., Newark, N. J.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

General Agriculture

CURING ALFALFA.

AT a farmers' institute in Wisconsin, Ex-Gov Hoard talked on alfalfa most of which applies to humid regions. But as there are points in it which may be of value to Californians, we reprint a report of the speech. One point in particular regarding added value if cured in shade looks reasonable. It is probable that California farmers will not buy caps because they are not absolutely required by the weather conditions. Gov. Hoard said:

"A number of years ago I was led to question very seriously in my own mind whether I, as a farmer or a student of farming, and whether farmers in general, had the right idea about curing hay. The more I thought about it, the more I observed, the more I studied. I made up my mind that they did not have it and that I did not have it, and that people called hay cured when it was only dried, but it was not cured, and it was injured, really injured, in its feeding value by the actinic effect of the sun's rays upon it.

"This was the first thing that set me to thinking—and I was not looking for this at all, I was hunting for something else. I had a Jersey cow that would make a pound and a half of butter on pasture a day. I wanted to know how many pounds of grass a cow would graze in twenty-four hours. Nobody had ever found out; it was all guess work and conjecture. I said to myself, if I take a lawn mower and cut two-inch clippings and feed to that cow all she will eat and she holds up to a pound and a half of butter a day, I have given her then just as much as she would take grazing. I will shut her up and give her all the water she will take, but if the results are the same, it must be that I have given her as much, because she couldn't make a pound and a half of butter from any less.

"So I took this cow and shut her up and took the lawn mower and cut these lawn clippings and weighed them and gave them to her and found she would eat eighty pounds a day. She held up and made a pound and a half of butter. I weighed everything she ate and weighed what was left, and so I felt that I got at this judgment pretty closely.

"I then dried eighty pounds a day of the lawn-mower clippings in the hot sun, and I found I got eighteen pounds. Then I turned around and fed the cow eighteen pounds of that dry grass and she went down to a pound of butter a day.

"Now, what went out of that grass besides water? Something. And that set me to thinking. I said to myself, there is something in the process of the hot sun in evaporating the water, the juice, etc., out of that grass, that has taken something else with it, for that eighteen pounds of dried grass cannot make what the eighty pounds of green, juicy, succulent grass did make. And then I began to question the effect of the sunlight on the hay.

"Then, when I commenced growing alfalfa, the first cutting of alfalfa was right in a showery period, that time of year, and I wanted something to prevent its being wet, and I started in with the use of hay caps.

"Then I found the value of curing alfalfa in the shade. We take a lot of green alfalfa wilted, enough so it will handle fairly on the horserake, not too much, and cock it up and put into the shade. Then cover it with this hay cap and you retard the curing, making it cure slowly and you check the rapid evaporation, and you cause it to heat and it produces fermentation. Editor Wallace, of Wallace's Farmer, dropped a hint to me that I found was true, according to the physiology of the plant, that is, if you dry alfalfa in the hot sun you crisp the leaves up at once, and the water cannot get out of the stalk except through the leaves; the water exudes from the stalk through the leaf. If you crisp the leaf, you have checked the evaporation from the stalk, and you have very likely lost your leaf, and there you are. He asked me: 'I wonder if you know about that biological law?' Well, I didn't know, as well as he knew.

Gen. Burchard: I bet your mother always cured her herb crops in the shade.

Ex-Gov. Hoard: Well, women know things by intuition that men don't guess at. Yes, mother always cured her herbs in the shade. You go up into the old-fashioned Yankee garret and you will find the rafters all hanging full of catnip, and this, that and the other.

Mr. Everett: Don't forget the boneset.

Ex-Gov. Hoard: There isn't one of us old Yankee boys that can't remember the boneset.

"Then I made some experiments with the feeding value of hay cured under caps and hay cured in the sun, and I came to the conclusion solidly that hay cured in the sun loses an important part of its nutritive value as compared with hay cured in the shade.

"Now, then, you see what led me up to thinking and reading on this question. I am dealing with forces all the while, and I must work down to where those forces are dominant.

"Farmers, as a rule, do too much with their eyes shut. They see some of the forces lying at their feet; they know a few things by being familiar with them. But a man must get at the reason of things.

"And then I found that the hay cap is a wonderfully valuable thing. What does it do? It knocks you out of economical labor—you can't load the hay from the windrow with your hay loader; you can't have some of these labor-saving things and use them with alfalfa, and because you can't, men say 'I don't want it.'

"I want to say to you that the slushy reasoning of some men on this alfalfa question is amazing. Why, I was talking with an old German the other day, and he says: 'I want none of that alfalfa.' 'Why?' 'I don't want a thing to come when I want to cultivate my corn.' I said: 'God bless your brave heart, you have got more dollars' worth of alfalfa on the same ground than you would have of corn.' 'No.' 'Why, yes, you have. You never raised $50 worth of corn to the acre in your life, you know you never did.' 'Sure not, sure not. You got no $50 an acre on that alfalfa.' 'Yes,, I have; I have got more than that.' He stopped and scratched his old head. 'Is that so?' 'Sure,' I said; 'if you didn't have any corn at all and you had your alfalfa, you could buy your corn twice over. If you grow your alfalfa you could buy your corn. Just think of that.'

"And another man said: 'It is too much labor.' I asked him if it would be too much labor to save that amount of bran. 'Supposing you had five tons of bran out there to the acre, would you be saying it was too much labor to save that bran?' The old fellow said: 'To the devil with your talk. Who ever knew bran to grow like that?' And so you run up against these men. They put a 5-cent preju-

dice against a 50-cent piece of silver, and that is a losing business.

"Now, a man that undertakes to grow alfalfa must at the beginning make up his mind that he is going to do everything that is possible to make it profitable.

"Let me tell you what that hay cap did for me last fall. I had at least $500 or $600 worth of alfalfa out at the last cutting. I just barely had weather sufficient to get it into the cock, to rush things and cap it, when there came on three weeks of tremendous storms, three big rains, and three weeks that alfalfa stood out there, and I couldn't get it into the barn. Now, that hay was covered with those hay caps; most everybody believed that it would be absolutely worthless. We had to go about every two or three days and move those hay cocks onto fresh ground to keep them from smothering the alfalfa underneath, and finally there came a spell of dry weather and I got it into the barn, and I was offered $15 a ton, and I wouldn't take it for that hay.

"Now, to show what the storm did, there were certain cocks—six, I think—where the wind blew the caps off and after they got soaked by the rain, they were completely spoiled. Now, measure the whole of that crop by those six cocks that were spoiled; where would I have been if it had not been for those hay caps? You see, I got $500 or $600 worth of hay, and the hay caps saved it all, and they cost about 15 cents apiece. Of course, the farmer must take care of them; he must not let them lie on the ground to get mildewed; he must put them up in the shed, hang them over a pole, and they will last from three to five years. You can see that is a very important point in the economy of the thing.

"Another point in curing: Just as soon as that alfalfa has gone through a little sweating in the hay cock, open it out to the sun for an hour or two and get it into the barn as soon as you can. But be mighty careful about putting alfalfa into the barn without going through that sweating. It is that first fermentation, the first heating, that is the dangerous one. My associate editor, Gen. Burchard here, lost a large barn last year through spontaneous combustion from alfalfa. Mr. Wilcox, of Oakland, lost a barn a few years ago from spontaneous combustion of red clover. There was a big explosion in the barn and you could hear it a hundred rods, and it threw the whole side of the mow out, and the minute it got to the air, flames burst out.

"If the principle I have spoken of had been in the minds of these men, they would have first cocked up their alfalfa or clover and let it go through that first heating; then the second heat that you get in the mow is very light; it just warms up so that it doesn't hurt.

"Now, these are a few thoughts on that line, and the sooner this alfalfa can be got into the mow after going through that first heating, the better it is for the quality of the hay."—Hoard's Dairyman.

Soils poorly drained, and so long holding stagnant water, often in this way damage and finally destroy roots, thus causing the plants to perish. Plants suffer for want of oxygen when the air can not get to their roots.

The grain dealers of Tacoma and Seattle report greater receipt of smutty wheat this season than ever before.

Cotton in Imperial Valley

SNCE we have developed the fact that we can raise more cantaloupes in this valley than the markets of the country will take at a profit, we that live in the valley are looking for some crop which can be grown that will not be so perishable as cantaloupes, and that does not take so long to give financial returns as does alfalfa and stock. In fact, we must have something which does not take too much hard labor during the heat of the summer. It must be something which may be grown in summer and gathered in the fall and winter months, which is the most delightful time of the year in which to work in the Imperial Valley.

After considerable observation of experiments which have been tried, I think cotton will come as near filling these conditions as any dry climate plant, and make as sure returns as any crop. We have cotton growing on Mr. Aten's ranch north of El Centro. The California Development Company planted some as an experiment at Calexico when the office was first established there. Both of these plantings have been good and convincing evidence that cotton will grow successfully and that cotton growing, entered into by men who have grown cotton before, and who will vary their methods to meet Imperial conditions, need fear no failure. If there is any doubting Thomas or any Missourian who wishes "to be shown," let him go to Mr. Aten's ranch, two miles north of El Centro, and see for himself. Experienced cotton growers who have visited the valley think that without question the production here would be at least one bale and some feel sure that two bales per acre might be expected as the output. Cotton can be grown on that hard adobe soil which does not have sufficient water for raising barley. It does not require the amount of water which barley does.

The cotton begins to ripen about September 1st to the 10th and picking may be continued until December or even January. The picking is usually done by the hundred pounds, so that the pickers may use their own pleasure in long or short hours, or in the time of picking. This will give opportunity for fruit pickers, hop pickers or other laborers to come to the valley and work in the cotton field at a season when other work is light.

Interest is being created in this industry by Mr. Allen of Brawley, also by Mr. Aten of El Centro.—Arthur S Fell, El Centro.

IRRIGATION FOR HAWAII.

Frederick Hayes Newell, director of U. S. Reclamation Service, recently sailed for Honolulu to investigate the prospects of bringing irrigation to the dry sides of the islands and using that section for future home seekers who will live on small holdings. All the large tracts on the wet side of the islands are occupied by sugar plantations owned in big tracts.

Director Newell is the author of four books on irrigation and kindred subjects; he is secretary of the National Geographical Society, a member of the American Forestry Association and of the American Society of Civil Engineers and of the Institute of Mining Engineers.

He says that reclamation work has now progressed to a point where it is beginning to yield a profit in certain sections. Upward of $50,000,000 has been expended by the government on twenty-six different irrigation projects. One million two hundred and fifty thousand acres have been irrigated.

Most of the hop fields report that the green hops picked this year yield less than in former years. Some claim that the total yield will not exceed two-thirds that of last year.

Pioneer **Rubber Sanded** ROOFING

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

SILO AND SILAGE.

HOW delightfully boyish men are! Indeed, we all should be grown up children ready to play whenever the chance offers. The neighbors fortunately are not very near to be disturbed when the engineer turns loose his whistle, and the eight men of the silage crew stand round smiling like boys ready to begin work. The colts hitched to the low corn wagons jump and plunge at the engine's shrill screeching. This trick of whistling in a new job is a little romance in the engineer's mind. The engine to him is alive and must express its joy at once more starting into activity. The men stand at attention the colts find their legs and stand squarely waiting for some new surprise. The cutter starts to move slowly as the engineer gives the engine steam and again the colts stand on as few legs as a horse possibly can until the racket settles down into smooth running. The corn is on the travelling table and soon it is streaming down in little bits into the silo, some falling sharply down, other pieces floating lightly down until the corn comes down like rain around the men inside

the silo. Another year's corn crop is on its way to making cow ambrosia, or nectar, or whaever food of the gods appeals to the cow appetite.

Filling.

The large silo is 36 feet high and 26 in diameter; this is an immense maw to fill. Ten feet put in and tramped as solid as possible tomorrow morning will have sunk down to six; and so day after day, a quarter or more will sink down. This may seem like slow filling, ten feet a day, but it is the way to make sweet ensilage. Well ripened corn, with plenty of water and slow filling will make sweeter ensilage than rushing in the feed in a couple of days. It heats more slowly and settles best. The settling in layers is more uniform and the same silo will hold two weeks more feed than can be tramped into it when filled in a couple of days. The density makes the silo hold more and it also preserves the silage better from mold. There can be none of those spots of bitter white mold through out the mass.

Corn and Sorghum.

The cutter is now working on Indian corn but after a week will be running on the sorghum. Changes in cows, feeds must be gradual or else the cows may be made ill. If one form of corn is run in and then another form, the changes would be very abrupt. We avoid this by mixing the last day's run. When the corn is within one day's run of the end, then sorghum is added one load to two of corn, then two of sorghum to one of corn.

When sorghum is nearly run out, alfalfa is run in with it at the same rate. If green alfalfa is not available the poorer hay or foxtail and alfalfa is used, the last six inches being entirely of the hay. The last of the hay is piled on the plates of the silo. When fed out, the cows are worked gradually up to a food and then receive it in full amounts, and are gradually sloped off it on to the next kind of feed. As soon as the silage is in the silo it is ready to feed out; there need be no waiting for it to ripen. I do not like to lose the top inches with mold, so feed it off at once.

Repairing.

The only expense about maintaining a silo is the new lining about every ten years. The round silo is still perfect; the two square silos need lining again. Next year I am going to have three inch stuff ripped diagonally at the mill. When this is tacked around the silo every two inches, with the narrow side next to the wall and about three inches apart, cement is mixed about four to one of sharp sand, and the inside plastered smoothly. Two thin coats of cement and water finish it off on the surface. With a wooden silo the inside should be coated with coal tar every year to keep the acids from eating into the wood.

Size.

The size of a silo must be in proportion to the size of the herd. A herd of thirty cows can be maintained for six months on the silage that fills a silo 15 feet in diameter and 30 feet in height. Anyone building a silo today would naturally consider the concrete or brick silo first, the prices of lumber make this form of building the cheapest we can put up in the interior, where the long railroad haul raises the price of lumber greatly.

In feeding giving the cows about 40 pounds of corn silage with 10 of alfalfa hay to each animal will give satisfactory results. There is no cheaper feeding for dairy cows than this combination, and the milk produced is not at the expense of the cows' vitality.

Alfalfa.

There can be found no cheaper source of protein than alfalfa hay There is no cheaper hay than alfalfa to make under California sunshine. We do not need hay or night caps for the cocks. We can depend on the fickle weather being very sure not to rain during the three or four middle cuttings of alfalfa. The silo is a good place for the first crop with the foxtail and for the last crop. While we have plenty of corn land, we plant corn and use it for silage in preference to alfalfa, for with corn silage, we need the alfalfa for hay and long stuff.

Alfalfa King.

That great fortunes are made out of alfalfa we realize, even Henry Miler and Tevis alfalfa fields shrink to smallness when we read of those of Argentine. There alfalfa is measured by leagues and not by acres, one owner having leagues enough to make 192,000 acres! Poor man! Do you know I feel sorry for any one owning that much land! The joy of owning a ranch is in knowing every nook and corner of it. Every tree is known, in sunshine or under a cloudy sky. To know them when the early dawn throws the first light in misty softness on their still drooping sleeping leaves, or to see them outlined in yellow stillness of the sunset glow. That is the joy of owning a farm! It is owning a bit of beauty far more satisfying than the electric lighted streets of the city.—M. E. Sherman.

PROTEIN CONTENT OF DIFFRENT KINDS OF FEED.

While the protein content of different kinds of feeding stuffs, forage included, does not comprehend the entire feeding value, by any means, yet it affords a very good guide as a comparable view in this direction. As such the following table may be considered with interest:

Name of Feed	Lbs. Digestible Protein In one ton.
Corn silage	18
Alfalfa hay	220
Oat hay	86
Red Clover	136
Bran	244
Corn meal	158
Oil meal	586
Wet beet pulp	12
Ground barley	174
Ground oats	180
Middlings	256
Sugar beets	22
Mangles	22
Hominy Feed	150
Oat straw	24
Corn and cob meal	98
Cotton seed meal	744
Wheat	204
Timothy hay	56
Peavine hay	216
Peavine straw	86
Bermuda hay	136
Corn stover	36
Green alfalfa	78
Wheat straw	8
Green Kaffir corn	156
Dried brewers grains	314
Malt sprouts	372

—Hoard's Dairyman.

Try the "Feel"
of the Handle of a SHARPLES TUBULAR SEPARATOR

Turn it a few minutes.
Then try the handle of another separator.

Less weight, fewer parts, one bearing—a ball bearing—and suspended bowl in the Tubular.
More weight, more parts, more than one bearing, a top-heavy, supported bowl in other separators.
Of course the "feel" is different—as different as the separators.
And the grip of your hand on the handle is a good guide to a fair judgment of the difference between the Tubular and "bucket bowls."
Our Catalogue No 260 tells the scientific and mechanical reasons how the Tubular is different and why it is better than other separators—better in clean skimming, easier running, less repair bills, more economical oiling. Free for the asking. Write today for it.

Thoroughbred Berkshire Boars and Sows

THE TALK OF THE
Cream Separator World
The Improved De Laval

"It can't be beaten." "It's peaches and cream." "Nothing like it." "Ten years ahead of all others." "A triumph in separator construction." "Perfect in every feature."

These are but a few of the expressions one hears on every hand this year in praise of the new Improved DE LAVAL Cream Separator. From the Atlantic to the Pacific the Improved DE LAVAL has simply swept the field of all separator honors.

Well informed dairymen once they investigate the new DE LAVAL will have nothing else at any price or under any condition. In one instance 32 Wisconsin dairy farmers were forced to buy hand separators on account of their branch creamery closing down and 31 of them bought DE LAVAL machines, notwithstanding all would-be competing makes of separators were hot after the business. Like instances can be pointed out in almost every section of the country.

The improved DE LAVAL represents thirty years of manufacturing experience and the expenditure of many thousands of dollars in experimental work. It represents the knowledge gained from nearly a million DE LAVAL machines in practical use by dairymen throughout the world. It represents the best ideas and brain work of the world's most skilled separator and mechanical engineers. It is the product of the largest and finest equipped separator factory in existence.

Surely the 1908 DE LAVAL is ten years ahead of all others. If you havn't bought yours write today for a DE LAVAL catalogue and any desired information.

Los Alamitos Sugar Company **Los Alamitos, Cal.**

SOUTHERN CALIFORNIA DAIRY ASSOCIATION.

A new organization, which should be of considerable interest to the dairy farmers of California. has recently been started in the vicinity of Los Angeles.

The object of the Association is to produce absolutely pure and sanitary milk, deliver it, either direct to the consumer or to marketing agent, in good condition and at a price which will insure a fair profit to the producer.

The same general plan as followed by the ctrus, fruit, and walnut growers' associations has been adopted by this organization. Each member subscribes for one share of non-assessable stock and is given liberal time in which to pay for it. The money thus subscribed will be used for the purpose of establishing a creamery in or near Los Angeles, where the association will receive, process and sell their own product. At present the Association is marketing its entire product through one firm in Los Angeles.

The Association now has about 170 members. No attempt is being made to secure new members, the stock having been taken off the market for the present. The idea is not how large but rather how strong an organization may be made; although it is hoped to ultimately include all the independent dairymen of Southern California.

The Association is urging upon its members the importance of cleanliness, not only wanting them to observe the state, county and city sanitary laws but to even go farther in the matter, maintaining such absolute cleanliness in every way connected with the producing and handling of the milk, that every drop may be guaranteed absolutely pure.

The public is demanding pure clean milk and the Association proposes to supply such, getting it to the consumer as quickly as possible after production.

The Association will, no doubt, fill a long-felt want among the dairy farmers of this section of the state, by way of getting them a better market for their product and also a better price.

The officers and directors are: G. B. Miller, president; W. O. Graham, of Whittier, vice-president; P. P. Pallange of Norwalk, secretary; H J. Mayo, Compton; Jno. R. Venable, Los Alamitos; C. L. Dameron, Cypress; Geo. E. Preston, Buena Park, J. J. Orr, Norwalk; A. D. Stine, Artesia.

Offices in Severance building Los Angeles are in charge of C. H. Whipple.

BREEZY PAPER.

"The Separator News," published by The Sharples Separator Company, West Chester, Pa., is being sent out to readers—the autumn edition is 900,000 copies.

In this issue of "The Separator News" is more than usual variety of sound dairy counsel, from many different sources.

"The Separator News" will be mailed, prepaid to those who ask for it. Write to The Sharples Separator. Mention the Cultivator.

"GIANT COUCH" OR "BANCROFT GRASS."

We have from a subscriber, B. Harrison, at Burringbar, N. S. Wales, the following as to a grass which is succeeding in Australia:

This vigorous heavy-yielding grass deserves to be more widely known and cultivated, and to dairy farmers with whom abundance of feed is the greatest desideratum, it should prove of great value. It is fairly well distributed in the coastal districts of Queensland, but as yet it appears to be but little, if not altogether, unknown in the other States. It appears to prefer a moist situation where it will yield about 20 tons of fodder per acre per annum, but judging by its strong rooting system and remarkably vigorous growth it should be more productive, and equally as capable of resisting drought as the majority of the other grasses, and should prove very efficacious in the subjugation of noxious growth. It is slightly affected by frost, but in the spring months makes rapid growth, producing a great quantity of soft, succulent, fattening fodder, which is said to be relished by all kinds of stock. It is very difficult to procure seed as it is a very shy bearer, but like some of the other species, it is readily propagated from roots or portions of the stem. These when planted in the spring or early autumn months throw out runners which make rapid growth, and if protected will soon attain a height of four or five feet, and present a lovely and luxuriant mass of verdure. After cutting the lateral growth is checked and a good sole formed, producing a strong vertical growth. It is too coarse for hay but should make first-class pasture or ensilage. Farmers having poor soil should give it a trial.

BERKSHIRE SHOW AND SALE.

At a recent meeting of the Executive Committee of the American Berkshire Congress it was decided to hold an annual Berkshire show, the first to be held during the American Royal at Kansas City, Oct. 12-17, 1908, and to ask Berkshire breeders to contribute first-class gilts between the ages of six months and twelve months to a sale to be held in connection with the show. The net proceeds of the sale of such animals, after deducting express charges, etc., to constitute a prize fund, one-half of this fund to be added to the regular classification of the American Royal Show, and the other half to be equally distributed among the exhibitors of the several States donating sale animals. C. E. Sutton, Lawrence, Kas., is sales manager.

THE RIGHT OF IT.

"Produce good milk and cream and deliver it to the creamery often; also wash your separator twice a day; in fact, be a good, clean dairyman and don't do these things because you get a better price for your milk and cream, and neither should you do them because you are afraid that the inspector might catch you and make you pay a fine, but do these things because it is absolutely right. I have but little respect for a man who is good because he has to be good, but I will tip my hat any time to a man who does right because it is right without considering the reward or punishment."—James Sorenson in Dairy Record.

The Forty-seventh Annual State Fair of Oregon was held last week at Salem.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

IRRIGATION CONGRESS.

This is a great week for the little city of Albuquerque and we trust will result in bringing forth much of value to irrigation and conservation in this country. It is estimated that there are 25,000 visitors gathered to discuss and view the irrigation industries of New Mexico. Amongst these delegates are not only many prominent Americans but experts from France and other European countries. The vim and vigor with which the people of Albuquerque went at the arrangements for the convention is shown by the fact that that little city raised $100,000 for the building of a pavilion for the holding of this convention and carrying the expenses incident to the occasion.

PROTECTION FOR DAIRYMEN.

The number of times in which dairymen have been caught by irresponsible creamery men starting in business with insufficient capital establishing a credit, then going broke, with the principal sufferer the dairyman who has put hard cash and months of hard work into his product, is causing a monotony which some dairymen have resolved to terminate. At least in one of the leading dairy sections, the San Joaquin valley, the dairymen have combined and demanded that the cream buyer doing business with them put up a bond or good security with the local bank as a guarantee for the payment for cream. As the Dairy Review says:

The dairyman's product quickly runs into money and he ought to see that he is protected, and while the matter of security may seem unreasonable, yet the honest creameryman ought to welcome it. It is a protection to his business as well as to the patrons. While in one way it works possibly some hardships, yet it will prevent the "wild cat" creamery concerns coming along and taking a share of the business from legitimate concerns. It will eliminate the undesirable competitors and leave the field open to those doing a legitimate business, paying for cream all that the traffic will bear and meeting payments when due. The demand for dairy products is good and the consuming public is paying the price for them and the dairymen have a right to demand cash for their product or good security if there is the least question as to payment.

LIKEWISE THE FARMER.

Attend the primaries and discard all labels. Business men should do both in the present campaign. Vote for the right man, whether his political label be Republican, Democrat, or what not. If you are not familiar with the affiliations and character of the candidate in your home district, more shame to you. Find out at once. Satisfy yourself as to the actual standing of the candidates on the important economic questions liable to affect your business, and vote right. But begin with the primaries. The business man's active participation in politics should not be deferred until election. It should begin with the primary and the nomination. No political system ever devised could safely be allowed to run itself. Men are needed to run it, and the selection of the best men for the important offices is the largest of all the problems of politics. As far as practicable, business men should be induced to become candidates for political office—American Industries for September.

PRESERVE FERTILITY.

In addressing a Farmers' Institute at Springfield, Illinois, recently, Judge J. Otis Humphrey said:

"There is no country on earth where the hand of man has tilled the soil long and continuously that he has not ruined it. And if we here in America shall teach the world how to use the land without abusing it we will have written a new page in history. We will have made ourselves a name that will live forever, not only as agriculturists, but in the history of the progress of the world. Why not do it? I tell you we are just playing with the business of farming; we have not begun to do business yet; we don't know what a heritage we have here. It is the youth of the land that must make this development. The professor is on the right track; teach it to the children! Teach it to the children! That is where the power of the nation resides; the schools will make the thing go. Sooner or later we will get these great subjects drilled into the children of the day."

True, if we are to teach the world how to maintain our fertility we must begin with our own children. Furthermore if we are to preserve a heritage for them and for their children we must be still more insistent on taking up and learning these questions and teaching them than we have been in the past.

It seems slow and a round about way to thus begin with the youth of the land but let us call attention to what we believe is a proof of the advantage of such education. It is but a few years since certain organizations in this country proposed the adding to our public school courses lessons on the effect of alcohol upon the human system and the disastrous results from its use. These questions and other similar lessons taken up in physiology classes have been general in probably nearly every state in the Union. To say that the knowledge gained by these studies has been the entire cause of the recent remarkable opposition to the saloon in this country would without question be overstating the case. But that it is one of the factors in the great number which have influenced the American people to take such decided action we fully believe.

The beginning with the younger minds to instill into them the principles of agriculture is being recognized in many schools of the Middle West where corn judging contests and lessons on seed selection are taken up with children in the elementary schools.

The question of fertilization is as yet one which has hardly received the attention of which it is worthy. It is one of the hardest to understand and one which means more to the success of the agriculturists than any other unless it be that of marketing his products.

Teach the young the meaning of the chemical needs of the soil and the advantages of a proper mechanical condition in a way which will impress it upon their minds much more forcibly than to wait until driven into their comprehension by the hard knocks of experiences in later life.

WHERE HIDES GO.

The immensity of the leather industry is shown by a few figures in the Technical World. From them it appears that the shoe products to this country aggregate one million of dollars daily. One factory produces 10,000 pairs daily, using every 24 hours hides and skins of 7800 kids, 300 horses and colts, 300 calves, 425 steers. Six large concerns made in 1907, 25,000,000 pairs. There are twenty-seven shades of golden brown shoes alone, on the market. Fourteen factories in Lynn, Mass., are devoted to making shoe polish and stain. . . . In the search for a rapid tannage of sole leather, it is said that about $1,000,000 a year is expended;—more than $10,000,000 having been spent before the chromic process for tanning of upper shoe leather was mastered. . . . Many of us who know the price of steak will be surprised to know that sole leather brings 40 cents and belting buts 50 cents per pound. And one may add that some of the steak which we buy might much more consistently have been sold at the higher price.

THE IDEAL FARM HOME.

The farm home should be kept up to a high standard. At least it should be as good as the farm itself, or a little better. Too often it has been the reproach of the farmer that his barn is bigger and better than his house. The farmer has been subject to the criticism that he is more careful of his domestic animals than of his family.

The fact is that present day farmers are not making the most of their opportunities. Very much can be done with but little expense to make farm life better.—Scientific Farmer.

Shop Talk

TIME TO GET BUSY—The coming fall and winter season promises to be an exceptionally good one for business and the outlook is satisfactory in all lines. We make this statement after a careful study of the situation of affairs on the Pacific Coast. Are you, Mr. Man, with goods to sell, making the effort you should to secure business?

The purchasing power of the Pacific Coast can be reached through the columns of the Cultivator. The early advertiser is the first one to get results. Do not let your competitor get the bulge on you, but start your advertisement now. Results will commence a few days later. Remember you can place your advertisement in 12,600 homes every week, can tell the well-to-do home owner just what you want to and what you have to sell, through the Cultivator.

Use the Cultivator as advance agent and your interests will surely be advanced.

SUBSCRIPTIONS.—Orders are received at this office almost daily to discontinue or change the address of the Cultivator without giving the name of the post-office to which the paper has been going. Much confusion and delay would be avoided if every one would bear in mind that we have a large list and that it is impossible to find names without knowing the postoffice address. The list is indexed according to location and not according to name, so all can see the necessity of paying attention to this suggestion when sending their orders.

Agricultural Notes of the Pacific Coast

Northern California

Sacramento Valley is planning to make a fine display at the Alaska-Yukon Exposition.

Sacramento Land Company is putting out several thousand acres of alfalfa near Princeton, Colusa county.

The total shipments of fresh fruits from Vacaville this season are 856 cars or more than double that of last year, same date.

Yolo county sugar beets are yielding about 9 or 10 tons per acre. A few exceptional cases are known where they run as high as 25 tons.

A special examination of the soils of Tehama county, on the east side of Sacramento, is now being made by W. W. Mackie of the Bureau of Soils.

A Sebastopol apple packing house has received an order for 15,000 boxes of apples to be shipped to Australia. The expectation is the price will be about $3 per box.

David Lubin of Sacramento is now in Washington making final arrangements for the International Institute of Agriculture to be held in Rome next November.

Sacramento County Horticultural Commission is making an energetic fight against the admission of any citrus fruits which are infested with purple or red scale.

The creamery at the University Farm at Davis which opened on September 1st is proving very satisfactory and is working into regular lines as much as if operated in a commercial way.

Some of the wineries of Sonoma county are paying as high as $12 to $15 per ton for grapes under contract. To those on the outside who have not contracted, $8 or $10 are the ordinary prices.

The Petaluma branch of the Sonoma County Co-operative Association has withdrawn from the county organization because the Petaluma people felt they could market their product to better advantage.

Mr. McKaig of Stony Ford, Colusa county, has sent to the Sacramento Valley Development Association a sample of native grass very closely resembling the Japanese matting grass and it is declared almost equal to the matting grass.

At the last creamery pay day in Ferndale, the following prices were paid by the various creameries of that section: Capital, 28 cents; Central, 28; Cream City, 28; Eel River, 27¼; Ferndale, 28; Grizzly Bluff, 27¼; Pioneer, 27½; Riverside, 27½; Arcata Central, 25¼ and Arcata United, 25½.

Gridley, Butte county, has an 11-months-old calf giving milk. A local paper, in speaking of the incident, says that the calf gives about a pint at a milking, showing 5.6 pounds of butter fat. Either the calf or the newspaper is doing exceedingly well to get over five pounds of butter fat out of a pint of milk.

The principal objection which has been urged against the use of hop picking machines, which have been tried this year for the first time, is that the machine wastes considerable quantity of the hops. It is thought this can be overcome, however, and many predict that hand-picking is a thing of the past.

Central California

The Fresno county fair is in session this week.

It is thought the second crop of table grapes will bring a good price.

Selma shipped her first car of Sultana raisins last week to New York.

Cars of Lodi Tokays are commanding from $700 to $2000 in the Chicago markets.

A grower from Orange county is about to plant 80 acres of oranges at Weed Patch, Kern county.

A good fair was held in Stanislaus county last week. Exhibits were made from many sections of the San Joaquin valley.

Raisin growers of Dinuba recently held a meeting to confer with Armsby & Company to discuss the 4 cent raisin offer.

The Spreckles Sugar Factory at Salinas is having trouble to secure prompt delivery of beets under contract with the farmers.

An effort to bear the apple market at Watsonville was made last week and it was thought to be by concerted action of the buyers.

Delano is to have a rabbit drive October 6th and it is hoped excursions will bring drivers from various sections of California to assist.

One nursery company at Exeter has produced what it claims to be a seedless lime, also another freak which they call the seedless lemon.

California shipped from January to September 15, 7444 cars of fresh fruit to eastern markets. This is almost double the shipments of last year.

The pear and apple crops of Santa Clara valley are unusually promising. The quantity is satisfactory and most of the fruit is without blemish of any kind.

Monterey is making a strong fight to secure the next State Fruit Growers' Convention, although it is understood that Sacramento is anxious to secure it.

Tulare county claims she will be heard from in the near future as a producer of the best grade of English walnuts. Several orchards near Visalia have been able to show excellent results.

Grape growers in many sections say they will carry their fight for protection of their industry to the elections where candidates are known to be opposed to the wine industry.

Raisin growers generally think the Armsby 4 cent offer has so many strings to it that it is no offer at all, as it leaves the option of taking the grapes entirely at Armsby's discretion

County Entomologist Morris of Santa Clara county is engaged in experiments to see how the Argentine ant can be controlled. He thinks it can be accomplishe dby feeding them poisoned food.

The Watsonville Pajaronian is making a fight for an honest and attractive pack of apples which will give bigger returns and more renown to that section as a high grade apple producing center.

A lawsuit begun in Fresno county in which the farmer sued for damages because of water seepage on his land from a canal of the Fresno Ditch Company was decided by the lower court in favor of the ditch company, but on appeal has now been reversed.

Southern California

Orange County Poultry Association held its regular monthly meeting last week.

Riverside is engaged in growing beans the pods of which are a yard in length.

Orange County Nursery Company recently shipped a full car of small eucalyptus trees to one party in Elsinore.

San Jacinto is having a material increase in the number of dairies which have been started there in the last few months.

Many delegates from different sections of Southern California are attending the National Irrigation Congress at Albuquerque.

Anaheim is occasionally forwarding a carload of sweet potatoes to Los Angeles markets which bring the grower about $1.25 per sack.

The Fullerton-Placentia district of Orange county will ship about 700 cars of oranges this year which is slightly short of last year's output.

Every body is spraying celery this year in the hope of preventing blight which did vast damage until the present spraying remedy was discovered.

The Orange County Canning Company at Anaheim is now putting up about 12,000 quarts of tomatoes daily. The company is paying $7 a ton for tomatoes.

San Bernardino county has recently entered into a good roads campaign in an election for $625,000 bonds but they failed to carry by the necessary two-thirds vote.

Considerable attention is being attracted in some sections by Arabian alfalfa which has been tested and sometimes claimed to be superior to the ordinary kind.

Owing to lessened evaporation the mountain streams furnishing water for many irrigation schemes of Southern California began to increase in flow even before the recent rains.

All Southern California was visited last week by the heaviest September storm in the last fourteen years Much damage was done to drying raisins, hay, grain, and especially to the bean crop.

Some citrus growers claim that the shipments of early oranges will not be so extensive in Southern California this year as in the past. The feeling seems to be to allow other sections to take the record for the sour early fruit.

A few years ago growing pampas plumes was quite a factor on several Southern California ranches but this year the Carnival of Products Committee of Santa Ana finds difficulty in securing sufficient for ornamentation of streets and booths at its carnival.

The Fruit Growers' Association of Walnut, Los Angeles county recently held its annual picnic at which a business session was held and the following were elected directors for the coming year:

A. T. Currier, A. W. Lee, W. O. McClintock, W. H. Howell, Francisco Grazide, Dr. W. H. Dailey, M. A. St Clair. After the adjournment the directors organized by reelecting the former officers, viz.: President, A. T. Currier; vice-president, W. H. Howell; secretary and manager, R. S. Persons.

The Coast

Hop pickers of Oregon, are reporting an exceedingly light yield.

Farmers at Walla Walla, Washington, are plowing for fall wheat.

Oregon produces about $17,000,000 worth of dairy products annually.

Green prunes in Western Washington have sold at about $15 per ton.

The Idaho State Experiment Station will hold a farmers' institute at the State Fair.

Fifty farmers of Nez Perces, Idaho, are combined to build their own grain warehouse.

North Yakima shipped 120 cars of peaches and 30 cars of cherries to Eastern markets.

Portland recently had a glut of fresh fruit and peaches sold as low as 25 and 30 cents per box.

Walla Walla, Washington, has shipped 2,000,000 bushels of wheat since threshing began.

Oregon creameries claim to average a higher price for their produce than any state in the Union.

Owen, Washington, fruit growers have been greatly benefited by heavy rains which recently visited that section.

Investigation is being made of irrigation problems in Eastern Oregon by experts from the Oregon Agricultural College.

Preparations for the National Apple Show at Spokane are being perfected and a great showing of fruit is promised.

Lack of dryers will cause great loss among the prune orchards of Washington, the crop being too large for all to be cared for.

Great improvement in the field corn of Eastern Washington has been effected by a campaign of education in selecting better seed.

The Farmers' Union at Davenport, Washington, has voted unanimously to hold wheat for 90 cents per bushel. Present price is 78 cents.

A farmer in Yakima valley, Washington, will ship about 10 carloads of honey this year and claims his profit will be about $8 per hive.

Mountain apple crop of the high land near Lewiston, Idaho, is the largest and finest since the growing of fruit began in that section.

The University of Idaho at Moscow has installed a modern creamery and refrigerating plant and is teaching creamery practices in a practical way.

Forestry farms where forest trees will be cultivated and grown under scientific farming are to be introduced on the Nez Perces Indian Reservation in Idaho.

Southwestern Oregon has a good roads association organized recently for the purpose of arousing interest in the cause of good roads in that section of Oregon.

The management of the National Apple show to be held in December at Spokane is elated by the promise of Thomas A. Edison that he and his family will attend.

North Yakima, Washington, shipped 300 boxes of irrigated apples to the National Irrigation Congress at Albuquerque. The idea is to show the irrigators of the world that the Northwestern territory is producing some beautiful irrigated fruit.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

INBREEDING.

SOON the pullets that have been raised on the ranches of California this season will be picked over and sorted for layers and breeders for the coming year. Then the owner will look about for a cock or cockerel to mate with these selected birds. He may have some good ones of his own, but the fear of inbreeding is so strongly intrenched in his ideas of poultry raising that to do so he believes leads to disaster. It may be that he has been trying for years to develop a flock that will be more prolific layers than the average flock and in order to do so he has bought every year or two a male bird from some breeder who is supposed to have superior stock, but no two years from the same breeder. At the end of five years the chances are that he has not improved the laying qualities of the flock at all. One year a cockerel is bought from a man who is aiming to improve laying characteristics; the next year from a breeder who is

striving to win in the show room. The result is in the end nothing has been accomplished toward the end in view. All because of fear of inbreeding. Because we have been warned that the most dangerous thing the poultry man can do is to inbreed. The fact is that no excellence can be attained in breeding any kind of stock without inbreeding, and there is good reason to believe that the more family lines are crossed under favorable conditions the more securely fixed are the qualities sought. The breeder of Jerseys wants a long price for a certain heifer and among her valuable qualities he cites the fact that five times she traces back to Old Commassie. And the breeder of Shorthorns does not conceal the fact that his herd carries much of the blood through close inbreeding of some famous ancestor. It is not in breeding itself that is dangerous; it is inbreeding without thought, indiscriminate mating in which no thought is given to the characteristics of the parent stock as to health, vigor and power to transmit its excellence to the progeny.

No breed of fowls has ever been bred up to a high state of excellence without close and volumious inbreeding. It is impossible to perfect a strain without crossing family lines again and again. Don't make the mistake of selling a good male because by using him inbreeding will follow. A recent writer on this subject gives this advice:

If any one has a male bird which has shown strong prepotency which has decisively marked his chicks with improvement he should be kept and bred back to his best daughters another year in order to fix his good qualities on the flock and increase its value.

When mating fowls which are closely akin, care should be taken to mate the most vigorous specimens, for this will tend to increase the stamina of the family, while to admit weakly birds to a pen that is to be inbred is to open the way to decrease vitality as the bad qualities are transmitted as well as good ones and if both male and female possess similar weak points this weakness is apt to be intensified in the progeny

Don't be afraid to in-breed if you have strong, vigorous birds that possess qualities you are desirous of intensifying.

PRESERVING EGGS.

Last April hens were laying lots of eggs and they were retailing at 15 cents a dozen. Now they are climbing toward 40 cents a dozen, and soon will be 45. During the 15 cent period a thrifty friend of mine who has a flock of hens kept to supply family need, had a liberal supply of eggs but instead of selling them for 15 cents a dozen she bought a few pounds of water glass—got some hardwood kegs and some 10 gallon stone jars, packed the clean fresh eggs into these receptacles, taking care there were no cracked ones and then poured over them a solution made by adding one quart of water glas sto ten quarts of water, the water having been previously boiled and cooled. After the eggs were well covered with the solution covers were put on and they were left in a cool place for the summer. They are looked at occasionally to see that the solution had not evaporated enough to expose the top layer. The first of September my friend began using these preserved eggs, and it would be a crital housewife who would have any fault to find with them.

In April 1904 I filled a whiskey barrel with fresh eggs; they were kept during the summer in an ordinary store room fairly well protected from the sun. and in April 1905 these eggs were taken out and subjected to the criticism of several housekeepers, who pronounced them in excellent condition for cooking purposes. The cost of material to preserve these eggs

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

was about one cent per dozen. It is not necessary to keep eggs as long as these were kept, but the object in this case was to determine how long eggs would remain in a suitable condition to use under this treatment.

Care should be had in buying water glass for this purpose that a sample is secured, free from marked alkalinity especially if wooden vessels are to be used, as the shells will be darkened by the material acting on the wood. It is well to clear the inside of the barrel if wood is used. Stone jars are really the most satis factory but are also more costly.

POULTRY BREVITIES.

An unfertile egg will endure 100 degrees for weeks without spoiling while a fertile egg under the same conditions will be unfit for food in a few days.

* * *

Eggs are the foundation of the poultry industry and in buying stock one should keep this fact in mind. Not all winners in the show room are egg producers.

* * *

The pullets that have been so reared that they will begin laying early next month will be a source of profit. Those that delay laying until next spring will never pay for their rearing.

* * *

If every poultry keeper would make a practice of separating the males from the females as soon as the hatching season is past there would be less bad eggs going to market during the hot months. It is the fertile eggs that spoil.

* * *

In starting in the poultry business select the breed that you fancy. Don't choose one simply because someone has told you that it is the best breed on earth; there is no best breed. All have their good qualities. Select the one best adapted to your conditions and fancy.

* * *

Don't carry into next season unde sirable birds; among these are hens that lay soft shelled eggs habitually or ill shaped ones. Hens that have acquired vicious habits such as feather pulling, egg eating, should go. They will teach the habits to pullets and prevention is better than cure.

* * *

Roup.

I have a flock of very fine Buff Orpington pullets six and seven months old. These birds have been doing nicely and have made an excellent growth through the summer, but recently some of them seem to have bad colds and I fear a few are affected with roup. Now I do not want to lose any of these birds that can be possibly saved. What would you advise in way of treatment?—E. H. P.

It seems that our correspondent recognizes the fact that he has roup in the flock and as they are nice birds wishes to treat even the well developed cases of roup.

Without discussing the policy of such a course we will proceed to give the treatment of such cases. First, separate the well and sick birds, disinfect the pens and drinking water as advised in a recent number of the Cultivator.

Many times treatment with coal oil will cure very mild attacks of roup. Give all the affected birds about ¼ teaspoonful of Epsom Salts following this the following day with

Continued on Page 335

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will **prepay** freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

Small Fruits and Vegetables

THIS MONTH.

SEED for tomatoes and peppers for extra early planting in warm, protected sections may be planted now in beds. They must be in cold frame or at least where they can be protected.

Seeds of Yorkshire Hero peas can be planted now and if the winter is not too severe will bring very nice crops in January. Vetches and field peas are sown this month and turned under for green fertilizer in the spring. Sow spinach, radishes and onions and other hardy vegetables which add to the winter bill of fare. Rake off and burn all vines and rubbish in the garden for you will be far freer from fungous and insect pests by doing it.

RASPBERRIES.

IN making a plantation of raspberries select a good, strong, rich piece of ground. Mark off your rows 4 feet apart, then plant 3 feet apart in the rows, but before planting, unless the ground is very rich, I would advise digging holes and mixing up some well rotted manure with the soil and planting the roots in it, and unless the weather is wet at the time, I would put some water in the holes to settle the soil around the roots. After the soil is settled, put in a stake about 4½ feet above the ground to tie the canes to as they grow. Fill the holes, if they have not been filled, and cultivate the ground. When the plants are established and growing they will throw sucker-shoots or canes which will bear fruit for the following season.

The first year after planting, four of those canes which grow out from the roots should be selected and the rest kept cut off. The ground should be kept well watered and cultivated, but in the fall when the foliage begins to show a change of color, let the plants or bushes go to rest and when the foliage is nearly off, cut last year's wood down to the ground and tie up the four canes to the stake and cut them back to its height. Before the rains come, top dress with manure and fork or dig the ground over to cover the manure. Keep the ground clean and well cultivated and you will get considerable fruit. Some prefer growing the bushes spread out on wires but I prefer the stake as in picking you can get around the bushes and the air and sun can get at the fruit better.

During the second season keep the ground moist and well cultivated, but instead of leaving four canes grow up I would leave six, as the bushes will be larger and better able to sustain their fruitings. Then in the fall cut back the old wood that was tied up and has fruited and tie up the six that you left during the summer and cut them back to the height of the stake again. Don't be afraid of manuring the bushes as they are gross feeders. By feeding them well with water and cultivation, the raspberry will give you a certain income for several years, from seven to nine years being their profitable life.—John Burr, San Francisco.

METHOD OF SHIPPING EASTERN CELERY.

The greater part of the celery produced by the growers of Michigan, Ohio and New York is shipped in carload lots to the eastern cities. Some growers follow the practice of washing and boxing the entire crop, others wash and tie the celery in bunches and set them in an upright position on decks in a refrigerator car. The select bunches are usually boxed and placed in the middle of the car, filling up the space between the doors. As quickly as the car is filled it is re-iced and rushed to its destination by fast freight.

Several of the larger growers follow the plan of shipping in the rough; by this method only about two-thirds as many bunches can be placed in a car, but the expense of loading is greatly reduced.

The celery is lifted from the field, a few of the outer leaves pulled off, and the root trimmed roughly, after which the plants are tied in bunches of twelve to fourteen each by means of common binder twine. These bunches are loaded upon wagons and hurried to the car before the celery has had time to become wilted. The first course is set root end down on the floor of the car and two decks are put in above, which will fill the car to the roof, and the space between the doors is filled in the same manner. A car loaded by this method will hold about 950 bunches, and the celery is usualy in the car from three to ten days, during which time the temperature is kept down by means of ice.

ROOT CUTTINGS.

Many wooded plants will root easily now while it is warm. Cut new, well matured branches with six or eight eyes, take off the leaves and put them down in sand so that two or three eyes will be out. Water well and they will soon be rooted.

IMPROVED SMALL FRUIT PLANTS.

The Fair View Farm Nurseries of Burbank have just issued their catalogue for the coming season. Strawberries, raspberries, blackberries, dewberries, logans and phenomenals are the specialities. Messers G. H. Hopkins and Son, the proprietors, are putting up first class stock and building up a good business along these lines.

The booklet contains helpful suggestions on planting and care of plants. It may be had by writing G. H. Hopkins & Son, Burbank Cal.

A SAN JOAQUIN COUNTY ASPARAGUS FIELD.

FRUIT CURES.

"Grapes are wonderful things," said a vine-grower. "In Switzerland they have in the autumn a grape cure. Thousands of anaemic and nervous persons are benefited by this cure Eating a huge bunch of grapes every ten minutes all day long their cheeks soon bloom, they soon recover their health again.

"Fruit—all fruit—is medicinal. As a drink cure and as a blood purifier, what is there better than an apple? Did you ever hear of currant leaf poultices for gout? They are excellent, I asure you. And black currant jelly in water is a remedy for sore throat

"Pineapples are good for diphtheria, strawberries for rheumatism, mulberry juice for fevers, elderberry for chills, and lemon for colds, for headache and for bile."—Philadelphia "Bulletin."

The reclamation of 100,000 acres of land in the Sutter basin, near Yuba City, is under contemplation. It is expected to cost about one and a half million dollars.

Tulare grange was a strong factor in making the Tulare fair a success this year.

The Ornamental Garden

THIS MONTH.

THE time has come for bulb planting. The writer has Watsonias up and growing Gladioli, which were taken up early and dried off, may be planted now for an early bloom. In fact, all bulbs of hyacinths, tulips, narcissi, Easter lilies and St. Joseph lilies, cyclamen, ranunculus, anemones, ixias, tritonia, sparaxis and freesias and others are in order.

Pansies and stocks can be sown this month. Sow the last seed of sweet peas for winter blooming, also scarlet flax. Violets, stocks and pansy plants are put in the places where they are expected to bloom.

In the cooler sections, roses may be replanted now. This is a good time to go at the old lawn and renovate it; also plant a new one where needed. Less trouble will be experienced with Bermuda grass when planting lawn at this season of the year.

TO KILL DANDELIONS.

If there is a lawn or grass plot where dandelions have taken a firm hold, it is an almost hopeless task to attempt to dig them out. The dandelion is a perennial plant and has a strong, vigorous root. For this reason a single cutting of the tops will not often kill the plant. Only repeated cutting of the leaves will starve out the store of vitality contained in the root system. Neither is this repeated cutting and hacking of the turf conducive to a smooth and beautiful grass plot. Besides, the work of digging dandelions is not much like a vacation job; it is much more like good, hard, solid work.

One method of eradicating the dandelions, as well as other weeds. is that of literally "running them out" with strong growth of blue grass or other grasses having vigorous root growth. If persisted in, this means of fighting dandelions will surely win out in the end. The plan may not, however, be successful the first season. The measure of success depends largely upon ground gained in the seeding with grass seeds; this in turn depending upon the season and the vitality of seed sown. Eventually, though, grasses will drive out weeds if sown thickly and a thick, strong growth kept constant and vigorous.

A quicker method of dandelion extermination is carried on now quite extensively by the use of the iron sulphate spray. This is a solution of sulphate of iron in the proportion of about two pounds to one gallon of water, applied with a sprayer. Two or three applications, one week apart, will do the work. Grass seed should be sown at the same time, so that the dandelions may be replaced by a growth of grasses.

Sulphate of iron is not poisonous and is not expensive. It will not injure the grass, but will discolor light colored clothing and cement walks. It makes a cheap, easy and certain dandelion eradicator.

HOLLYHOCK RUST.

No doubt many people have noticed to their disgust that the leaves on the hollyhock are drying up and the plants are now unsightly, writes W. Paddock, of Colorado Agricultural College. It is human nature to attribute the ills to weather conditions. However, if we examine the underside of the leaves, we will find that the surface is thickly studded with small pustules. Innumerable seedlike bodies or spores are borne in each postule which are so light that they are readily scattered by the wind as well as by other means. When the spores are lodged on any green part of the hollyhock and sufficient moisture is present they germinate much the same as true seeds and penetrate the tissues of the plant. Once started the fungus plant usually spreads rapidly and absorbs the plant substance, hence the drying and shriveling of the leaves.

If it were worth while spraying with Bordeaux mixture would keep hollyhock plants comparatively healthy, or other fungicides might be used which would not discolor the plants. But it is not likely that many people will care to go to this trouble.

A GOLDENROD BREAKFAST.

"This is a pretty country entertainment, and the one in mind was given under wide-spreading trees on the lawn of a pretty suburban home," says a writer in Woman's Home Companion for September.

"Great bunches of goldenrod were dug up and transplanted into jardinieres and arranged on the lawn, with the grass as a carpet and the trees as a canopy.

"Two tables were used. In the center of one was a large, gilded, flaring-shaped basket filled with the goldenrod, and tied on the handle was a butterfly bow of pale yellow tulle, and festoons of the same extended to the four corners, where were placed four small baskets, also tied with bows of the tulle. The second table was resplendent with tall cut-glass candlesticks with yellow candles and shades. The place cards were white edged with gold.

"Gold-banded china was used and the same golden tint carried out in the menu. Cantaloupes, cream, eggs, cheese and frozen oranges in orange-peel baskets all will help to carry out the golden color."

PARCELS POST.

The Retail Grocers' Association of California in session recently in San Francisco "resolved" against the parcels post, after which J. R Newberry a large grocer of Los Angeles, said:

"The parcels post system is bound to be adopted in spite of all the opposition to it. If you knew what I do you would lose no time in reconsidering your resolution opposing it.

"Did you know the big express companies have raised $250,000 to fight the adoption of the parcels post law? Why have they done this? Because they represent one of the biggest trusts in this country. They are sending men all over the country to stir up opposition to the measure."

With all flowers, if the seeds are not wanted especially, it is an excellent rule to remove the seed vessels as soon as the flower begins to fade, or else gather the flowers for decoration use when in their prime.

Sacramento is finally awaking to its duty in regard to the printing of the proceedings of the last National Irrigation Congress and one public spirited citizen, Mr. G. W. Peltier has guaranteed, if funds are not secured in any other way, he will advance them himself.

Malthoid Roofing

Mr. C. H. Wagner, Gen. Mgr. Russ Lumber Co., San Diego, Cal., U. S. A., writes as follows: "A fire occured during the night of August 17th and was not discovered until morning. Blaze had died out as the roofing would not ignite. This roof is covered with your Malthoid Roofing. We consider that the resistance of the Malthoid Roofing stopped the blaze and saved the plant."

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Landscaping Small Plat.

What would you advise to plant in the way of flowering shrubs on a piece of ground 50 x 100 between the side of the house and driveway; thermometer in winter occasionally registering as low as 24 degrees. Would like to use evergreen shrubs and to have some in bloom each month. Thought of having a row of roses along driveway and arranging balance in clumps with other flowers, and walks between. —Subscriber, El Cajon.

It is difficult to suggest the arrangement of such a planting without having seen the location and having a knowledge of this particular piece of ground in its relation to the surroundings. If there are buildings to the rear, and no special view from the dweling would be obstructed I would plant a group of half a dozen palms—Chamaerops Excelsa—at the extreme end. It is a palm of great beauty, not a rapid grower and one of the hardiest and should be planted in a group or cluster, and can be so planted as close as six feet. Some of the Bamboos are of graceful and elegant form and hardy. I name two that rarely exceed 10 feet in height and grow into clumps that are a source of endless beauty for the eye—Arundinaria falcata and Bambusa metake. If these are used they should be planted so as not to obstruct the view from the house. The list of evergreen shrubs that are flowering, and will endure a temperature as low as 24 degrees is rather limited. A few that are often grown for hedges make beautiful specimens when grown as single specimens. The Laurustinus is one and Ligustrum amurense is another. Pittosporum tobira is also a fine shrub. Prunus caroliniana, while often used in the south for a hedge plant, makes a grand specimen when grown alone. I would name two more plants that are usually grown as vines, but unless one has seen them under conditions where they were grown as shrubs, with fertile soil and abundant water and free cutting back to keep them in bush form, there can be no idea of their beauty as a flowering shrub. Tecoma (Bignonia) capensis, is one and the other is Plumbago capensis. But to get good rich colored flowers and bright luxuriant foliage they must have plenty of water and fertile soil.—Q. A. L.

Hen Manure for Oranges.

How much hen manure may I safely use per orange tree?—E. H., Nestor.

One grower says three or four inches thick, but we think a half inch thick is plenty.

Grafting Walnuts.

I am thinking of putting out some walnuts. My notion is to gather the native walnuts and plant them in a nursery, and from these graft or bud at the proper time to what I want. When and how should the walnuts be planted? How old should they be before grafting? I suppose you are still in favor of the native walnut. Any instructions will be appreciated.—C.

I am quite convinced that the native walnut makes the best stock and have seen a good many trees that had been grafted, the oldest being about 16 or 17 years and having large tops.

Your plan of planting in nursery form is the right one as then any necessary selection for vigor or growth can be made. There is no particular way in which the nuts should be planted, other than to have them in a straight row and at about 15 to 18 inches apart and about 3 inches deep The planting is usually done in February, the nuts having been kept in a cool dry place. If the nursery trees have made a good growth they can be budded in the following September, or later if the sap is flowing well, or they can be grafted the following February. Trees that are under one half inch in diameter are too small to work well, either for budding or grafting.

Planting Barley.

I am contemplating sowing 20 acres of barley for hay. Please tell me whether it will be a good plan to let the grass start before plowing and when is the time to sow?—E. A. B., Anaheim.

The Cultivator would hardly want to hazard a guess on the best time to sow barley for the coming crop. Last year the early sown gave the best results. Some will sow on the fallow land before the rains come so as to be ready for the very first showers. Others may wait until toward spring and possibly have better results. It depends upon seasons, and upon your soil and moisture conditions. Consult your neighbors who are producing under similar conditions, and get better information than any one at a distance can give. Whenever you plant you will probably wish before the season is ended you had planted earlier or later.

Defective Teat.

Cow has one teat which occasionally does not give much milk. That quarter of bag then comes very full, almost as if caked. By the next milking it is softened up and the milk comes, gargety at first and rather small in quantity. In a few days she is all right again, although she never did give quite as much milk in that quarter as in the others. This trouble repeats itself once in three months. What is the trouble and what can be done for it?—C. M. H., Whittier.

Careful milking out clean every milking will end this trouble. M. E. S.

Removal of Afterbirth.

I am troubled more or less every fall with some of my cows not cleaning properly. I have one now with a calf three days old that has not cleaned at all. Please tell me what to do for her.—O. P.

Whenever a cow does not clean within twenty-four hours we go after the placenta and remove it by hand. This is done by greasing the hand and arm, first carefully trimming the nails to avoid wounding the parts Carefully remove the afterbirth from the buttons, taking it off and not tearing them loose, for they are part of the cow, going slowly and carefully, not to tear the walls of the womb. It is a simple matter, but if you lack courage, almost anyone who has handled cows will help you out. After the afterbirth is removed, use a douche twice a day of a quart of warm water with corrosive sublimate tablet dissolved in it. Continue until all discharges cease. I believe this trouble can be in a measure prevented by giving the cows a good dose of Glauber's salts, one pound to one ounce of ginger, as soon as they begin to show they will calve within twenty-four hours. Bran mashes fed for a couple of days before calving will help greatly. This trouble rarely comes in the spring when cows are on green, laxative foods.—M. E. S.

Old Age.

I have a mare about 20 years old. Until recently she had always been in good condition and health. Was never overworked and has done nothing for a year except light driving. About two months ago she became logy, did not travel free, when urged beyond a slow walk or jog would immediately slow down again. Is slowly losing flesh; eyes watery part of the time, sometimes moistening a small streak 2 to 4 inches below them.—F. B. M., Chula Vista.

If a chronic case, I should say, debility of old age and nothing can be done. If an acute case, I should look for the tetanus or lockjaw. Watch closely for further symptoms. I had an animal once that lived two weeks in this condition. M. E. S.

Mending the Clock.

I have cleaned our clock and find it runs and keeps excellent time but cannot mauage to make it strike. I seem to have ommitted to put in some attachment. How can I fix it?—H. S.

This is so entirely outside of agricultural lines that the best of our specialists seem unable to give any answer. We imagine however an examination of the interior may develop the need of some little screw or other factor which may cause the clock to go on a strike again.

Bees Injuring Fruit.

We are in receipt of an anonymous box of grapes, regarding which the writer insists that the bees are injurious to the fruit industry. We would have been glad to have published the article in question, had the correspondent sent us his name as an indicatiou of good faith. The Reverened Bob Burdette says that the moment he opens an envelope he looks for the signature. If the letter is anonymous he consigns it to the basket without so much as reading the first line. This is a good plan and we believe we will follow it in the future.

Weevil.

How can I keep weevil out of beans? Also does it hurt melon and pumpkin seeds to wash them?—F. C. M., Turlock.

Bi-sulphide of carbon is the best remedy for the weevil, assuming that you mean the weevil that attacks the bean after storing. The beans are placed in an air tight room or box and bi-sulphide of carbon is used at the rate of oue pound to 100 bushels of beans. This is poured in a dish and the room or box instantly closed. Care must be used to keep from all danger of fire because the gas which comes from the bi-sulphide is very explosive.

When the melon or pumpkin seeds and pulp are fomenting so as to soften the pulp for removal from the seeds, rain water must uot be added. But after this is accomplished and the seeds removed from the pulp they are thrown into clear water and washed.

Bread for Hens.

What is the value of bread which is not musty? Can I pay one cent per loaf when wheat is $2 and corn $2.15 per hundred? Is there danger of over feeding ripe tomatoes and melons? We notice they eat these in large quantities.—Inquirer, San Diego.

We would surely buy all the bread we could get at one cent per loaf We assume you mean the ordinary one pound loaf. This would be at the rate of only $1 per hundred pounds for the most nutritive part of the wheat. It is possible that continuous feeding on the one diet would not keep the hens in the best of condition and the coarse grain would be necessary in a small quantity to balance the ration. We would however cut out wheat when feeding the bread. We do not believe there is danger of feeding too many vegetables or fruits. We imagine chard is the best vegetable to raise exclusively for poultry but would surely save all waste from the garden.

Basswood—Feed for Cows.

Has Eastern basswood or linden been planted in the San Joaquin valley? How many times per day should dairy cows be fed when they are kept in corral, their entire fare consisting of alfalfa hay?—Beginner, Modesto.

We cannot say as to the linden in the San Joaquin valley but know that it has grown well in Los Angeles county and makes a beautiful tree. Will some of our subscribers in the San Joaquin inform us as to its success there?

We notice in the corrals of some of the dairymen large racks which are kept supplied with alfalfa hay continually. We believe this would be our plan that the cows might go to the alfalfa as they preferred.

Ants.

As there have been several items in your paper lately about keeping the industrious and annoying little ants out of the pantry and victuals, it may be helpful to some one to know our plan.

In the first place we began with our safe in which we keep our victuals by putting the legs into old cans as stated in one of the other papers, only we used insect powder or buhach instead of liquid of any kind as it is cleaner and does not evaporate as any water preparation will. If cob webs and dust are not allowed to get too thick, will keep them off for a year or more without renewal.

On shelves that we attached to the sides of the building we use a top shelf one inch shorter and kept out from the wall ½ inch with double pointed tacks or short screws or anything that will answer for short legs on the under side of the top shelf. Then place enough powder on the shelf to cover a spot about as large as a silver dollar so these little legs will stand in the ceuter of each spot of powder then by being careful not to let milk pans or dishes extend over the sides against the building we have no trouble.

The top shelf can easily be made of two or three lath fastened together with small cleats and be lighter to handle when cleaning the shelves.

With best wishes for your very helpful paper I remain.—F. M. Smith. Ventura.

Locoed Horse.

Is there any remedy or cure for a locoed horse? I have one that is in the first stage from eating loco weed or rattle-box.—E. T., Turlock.

The government is investigating the question asked above, but as yet we believe there is no satisfactory

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

remedy known. The writer has had just such an experience with an animal and was never able to accomplish anything other than to keep the animal from becoming excited or overheated, as much as possible.

Breeds of Hogs.

Having forty acres adapted to hog raising I wish to stock it with a pure strain of some good breed and am undecided what one to select. I wish to raise pedigreed stock for breeding purposes, as well as for market. Poland China seem to be the favorite here. What are the strong points in favor of Berkshires, the Duroc, and Poland China? What breed shall I select? I can produce plenty of corn, alfalfa, beets, melons and clover. —E. C. R., Lake county.

The inquirer asks questions which it would be impossible for any one to answer excepting himself. It has often been said regarding breeding of any kind of stock, "There is no best breed." The best breed for a particular case depends on the immediate situation, the market to be sought, and the most paying product for that market, and the fancy of the breeder. The fact that Poland Chinas are a favorite in the section in which E. R. has his ranch shows that they have been tested and found profitable. The Berkshire is a hog which readily adapts itself to almost any conditions and is grown all over the United States. It matures early, is a good grazer and fattens quickly. In tests in the Iowa Experiment Station the Berks made a daily gain of .98 pounds, the Poland Chinas .90, the Chester Whites .89.

The Poland China is the middle weight class, though they have been brought up to 200 pounds at 6 months. It is said to be the best breed to finish off early in fat form of any. The Chester White is another favorite in many parts of California. It carries too much fat to make, however, a good bacon hog.

The Duroc Jersey is one of the very best breeds and has many warm admirers in California. They mature early, are good feeders, and at the Ohio Experiment Station took on flesh at a cost of $2.27 per hundred pounds as against $2.33 for the Berkshire and $2.46 for the Chester Whites. "Types and Breeds of Farm Animals," also a new book on swine by F. D. Coburn of Kansas, now in press, would give much information to one intending to go into the swine industry.

Peckham Says:

What are you going to do with the boys? Keep them to work for a small salary all their lives? Why don't you

Send Them to Corcoran

Where each of them can become independently rich in a few years?

The Corcoran district is big—the opportunities are equally big. It is growing faster than any other section in California.

Thousands of acres, the richest in the State, are waiting for hustling young fellows—and it's easy to make there—all that is necessary is a willingness to work and intelligence to grasp the many opportunities that are waiting on every hand.

Come with us and let us show you the coming farming section of the State—where you can make $2000 a year—and bring the boys—let them see for themselves. It won't cost much to do it, or send for a copy of Profitable Realty, our magazine, which tells the story.

George C. Peckham & Company

Phones: Main 3221, F5392.

Bronze Turkeys.

In addition to the names of breeders of Bronze Turkeys given in answer to query last week we should have added the Stuhr-Williams Co., of Riverside have an excellent strain.

Ticks.

How may I get rid of blue ticks on chickens?—J. P. W., Porterville.

Grease the hens and spray the house thoroughly with strong distillate emulsion. See last week's Cultivator for answer to same query.

Wild Licorice.

Under separate cover I mail you weed said to be a pest worse than morning glory. It grows about two feet high and has a very tough root which is almost impossible to plow. I would like to know the name and the best way to fight it.—V. Walker, Santa Clara county.

The weed you find so troublesome a pest and so difficult to eradicate is Glycirrhiza glutinosa or Wild Liquorice, a native of this Coast and northward as far as Hudson's Bay. We were not aware of its ever having become a noxious weed, but if it has acquired these habits it will be found difficult to eradicate. Its roots are strong and deeply set, so that plowing them out is almost hopeless. The only method that promises success is to lay the affected fields to fallow for a season and systematically and continuously cut off each new stem as soon as it appears. If over an extensive surface this can be done by the cultivator.

Hot Tamales.

Please give me recipe for making hot tamales.—Subscriber, Irrigon, Oregon.

To prepare the corn, cover it with water, add the lime water and boil until the husks slip off easily between the fingers, then wash in cold water until perfectly white. The lime water is made by adding an ounce of common lime to a quart of water; stir well and settle. For the dough, add to one pint of corn meal one tablespoonful each of salt and lard, and enough boiling water to make a thick dough. For the filling, boil one pound of beef and pour over it hot beef fat; cut into small bits and season with salt and chile sauce. Put a layer of the dough in the husk, over this a tablespoonful of the prepared meat; roll like a cigarette, with a layer of dough between each husk. Tie each end and steam two hours.

Indian Game Fowls.

I am a subscriber of your paper and have been looking for advertisements of Indian game fowls in your columns. Where can I procure stock of that magnificent breed? Also where can I secure trap nests?—F. J. R., San Luis Rey, San Diego county.

Indian game fowl breeders should wake up and not hide their stock under a bushel, but proclaim it from the hilltops, or better, through the Cultivator columns. The trap nest may be procured from the Henry Albers Company, the Germain Seed Company, West Coast Stock Food Company of Los Angeles, or practically any poultry supply house advertising in the Cultivator.

Alligator Pears.

Regarding a query which recently occurred in the Cultivator, Mr. C. P. Taft of Orange writes that he does not know where alligator pear trees may be had. Also as to relative merits of Advance and Triumph loquats he could not say, as he is not acquainted with the latter. But he thinks both would do well in the Santa Rosa section, from which the query came.

Alfalfa.

I have a catalogue from an eastern nursery in which the claim is made that they have a variety of alfalfa or lucerne especially adapted to dry sandy land. Kindly let me know if this alfalfa would do well here where my soil is very sandy.—W. A. Kingsburg.

It would be impossible to give any information on this without knowing something of the variety. It may be the so-called Turkestan alfalfa which has been tested in Tulare county and found to do very well with a very small quantity of water. Where irrigation is impossible, the Turkestan has proved hardy and gives a very superior forage. Another variety, the Arabian, has lately been spoken of extensively. Regarding this we do not know other than that it was introduced by the Department of Agriculture and is said to be a prolific yielder.

Colorless Peaches.

A subscriber, J. C. Orrick from Cumberland, Maryland, sends the following: "In your issue of September 10th, A. L., San Bernardino, inquires as to lack of color in ripe peaches. I have known of two varieties (one of them the most delicious peach I ever ate) which never showed any color under any circumstances within my knowledge. But ordinarily the lack of color in standard varieties will be due to deficiency in the composition of soils. Since iron oxides are seldom or never present in California soil, I suggest the use of iron filings treated with weak hydrochloric acid and spread around the trees in very small quantities, about one foot from the trunk. The acid oxidizes the iron filings and seems to put the residual salts in proper shape for absorption by the trees. Since this is a good tonic and insecticide, it is worth trying for color of fruit as well."

Fistula.

Mr. Adam Bair, of Arroyo Grande, having cured a horse of fistula, writes: "Having cured a horse of mine of fistula I will give my remedy, as I notice a query, answered by R. T. W., in the Cultivator of September 10th. My horse had a fistula on the top of his neck, caused by a collar sore. After cleansing the sore out thoroughly I sifted pulverized bluestone in the hole and left it for a few days. Then I took hold of the top of the pipe and lifted it out, and in a short time the sore was entirely well."

Walnut Dip.

Kindly inform me as to what is the best solution for dipping walnuts for bleaching. Also what species of eucalyptus trees is the most profitable.—W. C., San Luis Obispo.

A bleach which was formerly used and was recommended by the University Experiment Station is as follows:

Six pounds of bleaching powder (also called chloride of lime) twelve pounds of sal-soda, fifty gallons water. Dissolve the bleaching powder in about four gallons of water, stirring until dissolved. Dissolve the sal-soda in about four gallons of water. Add one solution to the other and stir well, let the carbonate of lime settle to the bottom and draw off the clear liquor and add water to make a total of fifty gallons. Put the nuts in large dipping box or lath crate, immerse in the fluid, and then add one and one fourth pounds of fifty per cent sulphuric acid and agitate by raising and lowering the dipping box. The bleach

You shall seek that which you desire only by such means as are fair and lawful, and this shall leave you without bitternes toward men or shame before God. —Henry Van Dyke.

LAVINIA'S RUMMAGING.

"IT seemed like a good way to combine things—"

"Sort o' kill two birds with one stone," interjected Lavinia.

"That's it exactly, Miss Giles—select the things that we need for the missionary barrel, and put everything else in the rummage sale. Well, I must hurry along if I see every one on my list. You're the first one I've called on, and I'm glad you approve our plan."

Lavinia was straightening the mat on the porch as her visitor turned back to say: "Bring anything. Seem's as if people go crazy at a rummage sale—just as they do at an auction—and things sell if they aren't worth much. Just as if she'd bring anything that was," Mrs. Dempsey added contemptuously to herself as she closed the picket gate.

That afternoon Lavinia went up to the attic. "Well, I declare, I hardly know where to begin," she thought as she looked around. "There ain't any use opening that chest. My bedding's too good to give away to missionary barrels and rummage sales," and she turned away. "Here's those old Gazettes; I don't b'lieve there's any use keeping them any longer. Sakes alive! what a pack"—and she took them from the shelf. "They'll be nice for the barrel. Missionaries don't have any too much reading matter, prob-ly, and I don't s'pose I'll ever look at them again. And this lot of stuff here—my! how things do accumulate." A glass vase with a broken edge, bits of discarded bric-a-brac, a dinner castor with the stopper gone from one of the cruets, pictures without frames and frames without pictures. From the heterogeneous mass she selected carefully. "Castors have gone out, but mebbe they'll come in again, some time; keep a thing seven years and it'll be in fashion, they say. Anyhow I b'lieve I'll put it in. I always did think a castor set off a table; makes such a tasty centerpiece. It's too bad that piece got nicked out of the infant Samuel"—she regarded ruefully a plaster of Paris image—"but I can fasten on a bow so as to hide it; they put ribbons on to everything nowadays. Anyway she said to bring anything. I'm going to give this thermometer, too. I never had no use for a thermometer; I know when I'm cold and when I'm warm without looking at a toob of quicksilver."

Once Lavinia raised her hand to take from a nail a not immaculate lithograph of most improbable fruit, but she drew back. "I don't know as anybody'd buy it, on account of that stain; besides, I might want to clean it and put it back in the dining-room some time," she said irresolutely, but she lifted the picture down.

From a trunk in the corner she took a knitted shawl. "I could color it," and she looked at it critically, "but I don't know as it would pay, on account of those moth holes—that's what comes of trusting to other folks to put away things when you're laid up and can't do for yourself, but they can be ketched together; it'll do for the barrel, it's real warm. And here's that purple fascinator Mary Ann sent me—if that ain't the most outlandish color to make a fascinator! even the moths wouldn't touch it"—she smiled a grim smile—"but it's just as good as new, for I ain't ever had it on;" and she added it to the heap. Then she took out a pair of "arctics," gray and rusty looking. "These are real good ar'tics," she said, "not a break in them. I don't know whether I can find the strap to this one or not—but land! they can sew on a piece of black tape or something; a buckle being off don't hender the warmth. It's a wonder the moths didn't get at this brown coat. I don't know when I'm ever going to get around to make it over. It looks some threadbarer'n I was thinking, too, and the sleeves are awful old-fashioned." She worked into it and surveyed herself in a cracked mirror which hung on the wall. "Well, I declare, if I don't look as if I'd come out of the ark, and I must have been getting stout, it don't come together. It's short-waisted, too," she soliloquised, twisting around for a better view of the back. "Evidently there ain't any use keeping this, but it'll certainly make a fine coat for that missionary's wife."

She opened another trunk, which breathed out a powerful suggestion of mothballs. "I don't b'lieve there's any use opening this; I know just what's in it;" but she hurriedly went over the contents. Flannel underwear, yards of dress stuffs neatly folded in paper, layers of stockings and mittens rolled into balls. People often speculated as to what Lavinia Giles did with all the things she knit. She hesitated a little over the warm long-legged stockings; and once she stopped to unfold a gaily-striped scarf and look at it for a moment, waveringly. "I s'pose it's pretty cold out there in Dakota," she thought with a sigh, but the scarf was replaced with the other things.

Lavinia closed the trunk with a satisfied sniff at the strong odor; no danger of moths getting into that. "When I do things I do 'em right. There's that big packing trunk full of things, too, but I won't disturb it; they're just as good as these, every bit. Well, I guess I've looked around here long enough." She halted at the chest of bedding, and raising the cover, peered into it for a moment undecided, then shook her head, and went on down the narrow stairs.

There was a pause at the door of the hall closet, but more for the pleasure of viewing her possessions than for anything else. Every hook was full, every shelf piled high. "I don't b'lieve there's many houses in Grafton any better stocked than this is," she said complacently, as she adjusted the folds of a gown that encroached too much upon its fellows. "If I was to drop off sudden I wouldn't have any call to feel ashamed of the neighbors coming in and looking through my things."

Just then there was a faint knocking down stairs. It was Abby Parker, the thin-faced little seamstress, at the kitchen door. "I just stopped in to tell you that I can come Saturday, if Janie's all right, and if you want me," she said as she warmed her hands over the shining black stove. "She ain't feeling real well today, and I'm taking the day off to kind o' look after her, and to run over to Mrs. Dempsey's with my contribution—for the Aid Society, you know," she added, as Lavinia looked at her blankly. "Of course, I couldn't do much, but every little helps."

"What you going to give?" Lavinia asked bluntly.

Abby reddened a little at the abruptness. She lifted a small package from the chair where she had laid it, and untied the string. "I don't know but you'll think it's a pretty small contribution, Miss Giles," she said deprecatingly, "I couldn't find anything for the rummage sale."

"Well, for the land's sake, Abby Parker! you ain't going to send that collar?"

"Why, yes," Abby said, somewhat taken aback, "ain't it all right? Won't they like it?"

"Oh, they'll like it fast enough—but it's that handsome new collar your cousin from Philadelphy sent you. I don't b'lieve you've ever wore it."

"Oh, no," quickly replied Abby, "I haven't. It ain't been out of my bu-

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

reau drawer, except just to look at, since it come. I'm going to ask 'em to put it in the barrel. I thought," she said, as she stooped to pick a stray thread from her skirt, "that I'd like to send that home missionary's wife something kind 'o pretty to wear. I know all she asked for in the letter was the things they had to have, but I think it's real pleasant," she added, hesitatingly, "to have something besides just necessary things sometimes."

After Abby had gone Lavinia sat a long time by the stove. The tea-kettle rocked comfortably back and forth for a while, singing its happy little song, then as if impatient at being ignored, began to bubble over clamorously.

Lavinia rose mechanically and set it further back. "A selfish, good-for-nothing old thing," she uttered sadly. The tea-kettle, evidently hurt, subsided into a protesting murmur.

"I never realized," she said humbly, "what a perfect miser I'm getting to be." Turning, she looked steadily at herself in the little kitchen mirror. "Don't seem 's it could be me. I didn't use to be so stingy. What would pa and ma've thought! I hope to mercy they don't know. Someways it's been so long sence I've had anybody to care about or do for—and living alone and all—I s'pose I've got kind o' warped." The face in the glass grew blurred. Lavinia laid her head against the shelf for a moment, then raising it with an impatient motion she went resolutely upstairs.

"I expect it'll come pretty hard," she said, "but I'm going through this house from top to bottom, and I'm going to give till it hurts, and then I'm going to keep right on giving till it stops hurting, as that preacher said."
—Country Gentleman.

HOW TO LIVE LONG.

A SUBSCRIBER writes, inquiring if I can give him a few simple rules, which, if followed, will tend to produce longevity. You bet I can; he has come to the right man. For some time past I have been carefully and thoughtfully investigating this important subject, and I have compiled a set of rules, each one of which was given to the world by a recognized authority and scientific expert. I claim no credit for these rules, for mine has been merely the work of the compiler, and far profounder savants than I, delving amidst the secrets of nature have discovered and given them to the world. But here they are, every one of them bearing the trademark of some gifted and tireless investigator:

Don't sleep within walls, for life-giving ozone is less plentiful there.

Don't sleep out of doors, for the outer night atmosphere tends to the development of malignant germs.

Don't drink during meals, for nature should supply its own moisture for food.

Don't drink between meals, for in so doing you impede the digestive organs and sooner or later a breakdown must result.

Don't drink alcoholic liquors at any time, for their unnatural stimulation must result in reaction.

Drink alcoholic liquors moderately, for tired nature must be toned up to its normal condition.

Eat only fruit and nuts, for it is demonstrable that they supply the proteids or tissue builders.

Make meat your principal diet, for it supplies the body with heat, which is but another name for energy.

Be extremely cautious not to eat anything that you like.

Feel no hesitation about eating anything that you don't like.

Bathe daily in cold water.

Bathe daily in hot water.

Take baths but rarely, for they are weakening.

Don't worry. Perhaps you cannot help it, but don't anyway.

Keep a cheerful spirit, but preserving it in alcohol in order to keep it is recommended only where other means fail.

Don't breathe air that contains microbes. (N. B.—All air contains microbes, so you should be particularly cautious about heeding this rule.)

Don't handle money. It disseminates microbes.

Don't kiss the girls. So do they.

As has been said, there is not a rule in this list, I believe, which was not first promulgated by some recognized scientist and savant, and by carefully following them all, a long and miserable life should be assured. Anybody thus can live to old age—if he wants to pay the price, and I hope that all of my readers will do so.

But what about myself, do you say? Oh, I have concluded that for my part I will pull along as did my grandpas, disregarding these simple laws of health and cutting myself off in the prime of my young manhood, as they did, at somewhere between 80 and 95 years of age. They did not heed the microbes, they breathed when and where they pleased, they ate and drank what they chose, and so they wrecked and terminated their lives while they still lacked a little of reaching the century mark; and that is the kind of wrecker I am. I may die with the bloom and flush of ninety years upon my youthful brow, thus failing of that old age which I might reach, but I am blessed if I am going to heed rules which only a fool would follow, and he can't.

Still probably you should follow these rules, as some of you try to do, for a multitude of sages have announced that they will result in longevity and anybody should see that it is worth while to make oneself miserable in order to have a long period of the misery.—Waterhouse's Paper.

HOME-MADE FRUIT JUICES.

Before beginning to prepare grape juice—and the same rule applies to other fruit juices—be sure that you have a supply of good sound bottles on hand. Whether the bottles have been used before or not, be careful to sterilize both the bottles and corks. Then wash the grapes thoroughly to remove all dust and germs.

When the grapes have been cleansed, pick them from the stems and put them into the preserving kettle. Let them boil gently for about half an hour over a slow fire and, as they cook, crush them with a wooden spoon. At the expiration of the half hour press them through a colander or cheesecloth sieve; then put the strained juice into a preserving kettle and let it boil up.

As soon as it has boiled move it from the fire and skim it. Repeat this operation and after it has been skimmed the second time add about a gill of sugar to each quart of juice and stir the mixture until the sugar has dissolved. Then let it boil for five minutes longer, skim it very carefully and pour the result into the bottles, which must previously have been heated. Set some pans of boiling water in a moderately hot oven and stand the bottles in them as they are filled. Let them remain there for fully ten minutes, then set them where they can cool, being careful not to put them in too cold a place or where they will be in a draught.

To make strawberry, raspberry or blackberry fruit juices, proceed exactly as you would for grapes until you come to the addition of the sugar, as these berries require fully a half pint of sugar to each quart of the juice.

This receipe does not keep the natural fruit flavor as does the usual method of sterilizing the juice in bottles, but this makes a nice drink and one especially valuable in making fruitades, etc.

HOMELY HINTS.

When flatirons become rough or sticky, lay a little salt on a flat surface and rub the irons over it well.

One tablespoonful of turpentine put in the water in which clothes are boiled is an excellent way to whiten them.

Dry salt in the oven with a teaspoonful of cornstarch before filling salt shakers. This keeps the salt from lumping.

To remove grass stain, rub the stain well with alcohol before the garment has been wet; a thorough application will remove all traces of stain.

Fresh Fruits.

A large amount of partially spoiled grapes was on the market yesterday. This is the first of the damaged fruit that has reached here since the rain, but the condition of these few boxes shows that the damage to the whole crop has been considerable. The fact that the grapes on practically every vine were spoiled more or less has had demoralizing effect on the market.

Dried Fruits.

The dried fruit market has been slightly strengthened by the storms of last week. A Fresno raisin grower says:

During the past few weeks I have tried to make as careful and complete an investigation from both points of view as it was, or is possible to make, and believe that this year's crop will not exceed 40,000 tons.

Every grower knows, and most packers concede, that last year was an unusually favorable one for the development of sugar in the fruit; this applies to all kinds of dried fruit, and was especially noticeable in prunes and raisins. Last year the average weight of sweat-boxes was about 175 pounds, against a normal weight of 140 pounds. This, with the well-known tray shortage, will bring this year's crop to little more than 50 per cent of last year's crop.

Another important fact, upon which nearly all growers agree, is that the berries are much smaller this year, and will therefore run to a greater percentage of two-crowns than usual. This will naturally make the tray weight of the fruit less, besides creating a decided shortage in the percentage of three and four-crowns.

Hay.

Arrivals of hay continue to run quite heavy, the total for the week ending today amounting to 3670 tons but little less than last week. It was generally expected that shipments would materially decrease about the middle of September in anticipation of rain. There seems to be quite a little out of doors however, and shipments from what are generally considered as outside points continue quite freely. Our present range of prices which is considerably above the average for this time of year, is attracting attention on many sides, sample shipments being made from Nevada from which state there is apparently quite a surplus of hay which can be brought

here under a moderate freight rate. For our fancy grades of hay we must depend on our own state and already both choice wheat and choice tame oat hay is being taken from the warehouses, same finding ready sale here is marketed sparingly.

The only item of interest during the past few days to be reported is the advertising for 10,000 tons of hay by the Government for shipment to Manila. As the delivery of this quantity will probably extend over a period of months and as it is generally conceded that because of lower prices this business must necessarily go to Seattle, we can hardly expect our market to be affected in any way.

Citrus Market

LOS ANGELES, Sept. 30, 1908.

The orange market is still more satisfactory and the few remaining will close at satisfactory prices. Extra choice are now selling at $3.00 and $3.50 per box in most Eastern markets. No fancy prices will be realized but the present conditions will probably continue until the end of the season.

Lemons are going forward daily and commanding good prices.

Shipments.

Shipments of citrus fruits since Nov. 1, '07, aggregate 28,904 of which 4593 were lemons. To same date last season 27,263 of which 3332 were lemons.

QUERIES.

Continued from Page 331.

should be reached in five or ten seconds, and the nuts are then washed in clear water and put to dry. Of course to employ this process cheaply specially contrived dipping appliances are used. The same liquor can be used with new batches of nuts so long as the proper effect is produced and small additions of acid will prolong the efficiency of the liquor.

We believe however that the above is the same process of which a firm claims the patent and on which suit has been begun to prevent growers using it without paying royalty. The other process which has often been used is the simple one of placing the nuts in a closed aperture and subjecting for about thirty minutes to the fumes of sulphur. A newer one which has been tested and will be used this season for the first time in a commercial way is the salt solution which is treated with a current of electricity in such a way as to release the chlorine. This is said to be the most perfect dip which has ever been tried upon walnuts.

The most profitable eucalyptus to raise can only be decided by knowing to what uses you expect to put it and something of soil and climatic conditions. Should you ask what is the best apple to plant, we would have to say it would depend upon the market and whether you wanted spring or winter crops. The same, in a slightly different measure, is true of planting forest trees.

Diseased Grape Leaves—Beetle.

I am sending a branch of one of my young grape vines I planted last spring and some of them are suffering, as you will see by the branch, from what looks like a mildew, but on close inspection I see some little long bugs on them. Please tell me what is the trouble and what to do for them and when to do it.

I have a fine large weeping willow tree by my house, of which I think a great deal. It has been attacked this summer and fall by a grub worm, which I am afraid will kill it. The worm is about three inches long and as large as my little finger. It bores into the body and limbs of the tree and causes a loss of sap and the tree to rot. What can I do to rid the tree of them?

I inclose with grape branch a bug that did great damage to my young plum trees. They eat all the buds and new growth that would start out on the young trees. What is the bug? And what can I do next spring to keep them from destroying the trees again? What few leaves are left are green, but the tree made no growth. Will the trees be all right next year or had I better dig them up and plant others?—C. M. M., Garden Grove.

The leaves were referred to the Pathological Laboratory at Whittier and answer was made as follows: "I think that I may safely diagnose from the specimens that your reader's vines are suffering from Brunissure. Brunissure is the name given to the browning of the leaf blade in vines debilitated from overbearing or other causes, and the only remedy for it is to improve the health and vigor of the affected vines. If at pruning time the cut surfaces of the spurs do not turn blue on being touched with a drop of a one per cent watery solution of iodine, fertilization should be resorted to; nitrogenous manures, especially those in which the nitrogen is present as a nitrate, being favored."

In the same box was a large brown beetle which was referred to Prof Quayle at Whittier who writes. "The large beetle is one belonging to the group commonly known as Leaf Chafers and bears the scientific name of Serica mixta. The larva of this insect feeds upon the roots of plants, especially of grasses, and is more likely to infest the sandy soils. As an adult beetle, it feeds upon the foliage of a large variety of plants, and has been known to do considerable injury particularly to the grape in San Joaquin county."

The large worm on the willow we cannot name without seeing but will refer to Mr. Mills for practical remedy if he has one.

OIL EMULSIONS.

Continued from Page 318.

gallons of 8 per cent crude oil emulsion will cost about 80 cents.

Changed Conditions.

Changed conditions make it necessary often to vary slightly the making of the emulsion, for which reason we advise making a small amount first, which avoids losses in case it fails to emulsify the first time. In general, however, if the tank holds 200 gallons put in it about 100 gallons of water and the required amount of emulsifier, stir well and add the oil gradually. If it fails to emulsify add a tablespoonful, more or less, of caustic soda. Miscible oils may be made with this emulsifier, but is not of any advantage in field operations.

What we need is a ready prepared miscible oil. Prepared emulsifiers have been and are on the market, but they need considerable manipulating, so much in fact that the orchardist can just about as easily make his own emulsifier and save considerable expense. We need a preparation containing a given amount of oil which will mix readily with water. Private concerns have given this some attention, but not enough. If the orchardists can be provided with miscible oils at a reasonable price we believe the demand will increase with mutual benefit to all concerned.

ROUP.

Continued form Page 327.

a one grain dose of quinine. Swab the mouth and throat with a solution of equal parts peroxide of hydrogen and water, with a small rubber syringe inject some of this solution into the nostrils and roof of the mouth. Where the case is severe vary this treatment somewhat.

Give Epsom Salts, immerse the head of the fowl in the solution of peroxide of hydrogen and water, keep it there until the bird strangles somewhat. This will get the solution into the mouth, nostrils and thorax and eyes, all of which are affected.

If the disease manifests itself as canker remove the covering from the sores with a swab and bathe with the solution of peroxide of hydrogen.

Feed stimulating foods, as mashes of middling, corn meal and beef scrap. The mash may be mixed with broth made by boiling beef liver till it breaks up rapidly.

If swellings appear on the head, open, as they begin to soften and cleanse with a small syringe and inject peroxide and water until there is no foaming.

THE "BOSS"
Tree Protecter

Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. Can be easily removed; will last for years.

Agents Wanted Everywhere

YUCCA MANUFACTURING COMPANY
1380 Willow Street Los Angeles, Cal.

Come to Oakland for Business Training

Polytechnic Business College and School of Ehgineering,

306 Twelfth Street, Oakland, California.

offers by far the best facilities ever devised in the West for highgrade business training. This large institution is like a series of large business offices where students are trained in actual business practice. Every graduate of the complete business course of this college is employed. Pleasant, homelike places in private families, for young men and women, are reserved, practically at cost.

Courses in Business Training, Shorthand and Typewriting, Telegraphy, also Civil, Electrical, Mechanical and Mining Engineering.

FREE College Journal and one doz. Cards with your name written thereon will be sent any one upon request.

230,000 DAY OLD CHICKS.

Ducklings, Goslings, Turkeys etc. have already been sold this year by the Pioneer Hatchery Co., 112 E. 8th St., Los Angeles. This concern ships chicks to most all points in Arizona, Nevada, and California. Several shipments have safely been made to Yuba City. Shipments are made each week to Goldfield, with practically no loss in transit. This concern has recently moved into their own new building at 108-110 and 112 E. 8th st. and will have much more room for their growing business. Visitors are always welcome, and a price list will be mailed to any one on request giving prices of chicks and the eggs of all varieties.

COUNTRY BOYS WANTED FOR BUSINESS POSITIONS.

Business men of Oakland and San Francisco, and other large cities, want young men reared in the country to prepare for commercial positions. Experience has shown that the average boy from the farm has habits of industry and integrity that make for success.

The Polytechnic Business College of Oakland, Cal., has made a phenomenal record in training and placing young men and women in business positions and the College is so located as to provide homelike accommodations at very low rates.

It is said that every young man who has taken the complete course in business training at this College has received remunerative employment upon graduation.

An illustrated Catalogue will be sent free to any one who will write to Prof. W. E. Gibson, 306 Twelfth street, Oakland, Cal.

SAW WOOD.

Have you wood to saw? Posts? Poles? Have you any sawing of any kind, including the sawing down of trees of good size in the woods?

If you have, let us tell you that the Folding Sawing Machine advertised elsewhere in this paper is a mighty valuable thing for you. Leaf through this paper until you find the little advertisement and read it. Then write to the makers and give them a chance to tell you about it—what it is, what it does, how much labor it saves, how easily it is handled, how easy it is to carry about from place to place, etc.

The advertising is just started in our paper. We welcome it because the Folding Sawing Machine is something every man with wood sawing to do ought to have. Don't fail to look up the ad and then write to the Folding Sawing Machine Co., Chicago and let them tell you all about the machine.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

The Tomato and Potato Blight

A Paper by Prof. Ralph E. Smith of the Southern California Pathalogical Laboratory. An Important Article Full of Suggestions on Care of Fall Tomatoes

As the time approaches for the fall crop of tomatoes every thoughtful grower must have in mind the disastrous experience of last year with this crop and the thought of what must be done during the present season to prevent the recurrence of such a condition. While we know that the tomato blight does not occur every year, and may not put in an appearance at all during the present season, the fact that it may come on if weather conditions are favorable as severely as it did last year makes it very important for every grower to make some preparation against this disease, writes Prof. Smith in the Orange County Tribune.

First of all one should have clearly in mind just what the trouble is which may be controlled by the methods to be described in this paper. Tomatoes are subject to various troubles and diseases, only one of which is now under consideration. This is the so-called "winter blight," which is characterized by a sudden killing of the vine, accompanied by spotting and decay of the green fruit, which occurs only at times of considerable moisture. As is well known to the growers, the blight appears following heavy rains and moist weather, occurring therefore only during the rainy season. The various troubles with tomatoes which occur during the summer have no connection with the winter blight and cannot be controlled by the treatment herein outlined.

The winter blight of the tomato is the same disease as the blight of the potato, which causes the leaves to turn black and the vines to die under similar weather conditions as those which bring about the tomato disease. The treatment described applies equally well to both crops. In either case the blight may be looked for at any time during the rainy season when the crop is growing. That is to say, tomatoes or potatoes may be affected in the spring as well as in the fall, if the plants are growing at that time and abundant rains occur.

The treatment for the control of tomato blight which was so successfully demonstrated last fall at the Whittier laboratory consists in spraying the vines immediately after the occurrence of rain with the Bordeaux mixture, a combination of bluestone and lime. The reason for the success of this treatment is that the blight is caused by a fungus which develops only under conditions of abundant moisture. When this occurs the fungus spreads very rapidly through the air in the form of minute germs or spores, and these spores develop on the surface of the leaves and start the blight fungus in the tissues of the same. If the leaves are covered with the Bordeaux mixture soon enough the spores are poisoned by this material and thus the fungus is kept from developing.

The fact may be accepted as thoroughly demonstrated that proper spraying will entirely control this disease. Those who saw the demonstration which was made on the laboratory grounds last fall will have no doubt of this fact. The sprayed vines continued growing and producing fruit until plowed under late in the winter, while those which were not sprayed were entirely killed and the fruit ruined after the rain. The main question which confronts the grower is whether it will pay to spray this year, or every year. He knows that there is a considerable chance that weather conditions will be such as to keep the blight from occurring, and also if he does spray that it will be at some additional expense. In the eastern states where rain is sure to occur at frequent intervals during the summer, potato growers spray their vines at intervals of about two weeks, knowing that the blight is sure to occur, and thus are able to save their crops. With us it is probably an even chance that no rain, and therefore no blight, will occur. Against this, however, is the experience of last year, when in a few days the whole crop was entirely ruined. Certainly a few dollars per acre expended at that time in spraying would have been most profitable.

In general, there are three methods which the grower may take. First, he may pay no attention to spraying whatever, taking his chances that early rains and blight will not occur. Second, he may spray his vines at about the time when the first rains might occur, say during the last of October, as a matter of precaution, following this up with later sprayings as the vines grow larger or after rain. Third, he may prepare materials to spray on short notice, but do no actual spraying unless rain occurs, spraying them immediately after the rain. Of these three methods, the first is a purely speculative practice and gives the grower no chance to prevent the loss of his crop should conditions occur which favor the blight. We believe that no careful man will take this risk if he values his crop. The second method has some advantages and some disadvantages. It permits a large acreage to be treated properly, where if one waits for the rain to occur he may not have time to get over as much ground. If the vines are thoroughly sprayed during the latter part of October, assuming that no rain has occurred up to that time, they will remain protected for several weeks and with another spraying early in December, this also regardless of the occurrence of rain, ought to carry the crop through the season. The work can be done more systematically and thoroughly in this manner than by waiting for rain to actually occur.

The one objection to this method is that if no blight occurs the expense of spraying will be lost and the expense of wiping the spray from the fruit, which must be done with tomatoes, might be a serious disadvantage in a season of no blight, large crops and low prices. Taking one season with another, however, we believe that for the grower with a large crop, or an association of growers if they prefer to do the spraying under one management, this is the only safe method to pursue. Whatever loss might occur by spraying in seasons of no blight would be more than made up in one year like the last.

The third method is the one which we would recommend to the grower who has his own spraying outfit and can get out at any time and spray his vines very promptly. If he has his pump and equipment in good working order and ready for business on an hour's notice and his materials ready to put together immediately, he is reasonably safe in waiting for rains to occur which might bring on the blight, and then getting to work during the first half day that it is not actually raining.

Each grower who intends to spray his vines must decide for himself which of the two latter methods he will follow.

In making the Bordeaux mixture the following formula is used:

5 pounds of bluestone.
5 pounds of quick lime.
50 gallons of water.

The lime should be slaked and the bluestone dissolved separately in portions of the water and the two then mixed together in a dilute condition. If very strong solutions are mixed the spray is not as good. The lime should be strained before mixing in order to take out the coarse particles and prevent clogging of the pump and nozzles.

In spraying the vines the outfit employed must be of the size and proportion to the acreage which is to be treated. Spray pumps and outfits can be obtained of all prices and sizes. The outfit should be mounted on a wagon and driven through the field, straddling one row, with hose long enough to extend to a considerable distance on the sides, in order to drive through the field as few times as possible. The vines must be completely covered with the spray, and this is best accomplished by having two nozzles on a Y at the end of a curved iron rod about four feet long. With such a rod the spray can be directed all through the vines and to the under sides of the leaves.

For large tomato vines about 150 gallons of spray per acre will be required, and the total expense for labor and material may be set at about $3.00 per acre for each application. In a season of average rainfall about two applications ought to be sufficient to carry the crop through. Some years more would be necessary, while in others no spraying at all would be required. It is certain that the price of tomatoes will depend on the occurrence of the blight and therefore extra sprayings ought to prove a very profitable investment in wet seasons.

As suggested before, it will be necessary to wipe sprayed fruit before shipment, on account of the small amount of spray which is visible on the surface. There is no danger whatever of poisoning from this source, the only disadvantage of the presence of the spray being the injury to the appearance of the fruit.

At the Whittier laboratory tomatoes are being grown and experimented with this season on a much larger scale than last and we shall be very glad to see or hear from any growers to whom we may be of assistance.—Ralph E. Smith.

Considering the progress in scientific agriculture, the steady increase in the yield per acre now going on, the vast expansion in trucking and fruit growing to meet the needs of an ever-expanding population, the great possibilities in irrigation and reclamation work, we can readily see that the agricultural interests of the country are only at the beginning of their real broad development, and that the future holds in store a prosperity much greater even than the magnificent advance since 1900 has brought them. These facts furnish a foundation for unbounded optimism as to the magnitude of our material progress in the future.

With the Citrus Growers

JUICY GRAPEFRUIT.

From a Department Bulletin we quote:

Grapefruit, or Pomelo, has been grown for centuries in Asia where the climate was suitable, and there the natives prize it greatly for its many medicinal properties. The name "grapefruit" comes from a tendency which some varieties have to grow in clusters on the trees, bunches of more than twenty having been found, every fruit of which weighed over a pound. The flavor of the fruit, also, is distinctly "grapey." With years of careful development, California now produces a finely flavored, aromatic, juicy fruit, with an improved flavor and increased medicinal qualities.

The California seedling Pomelo is much finer and thinner in skin than the "Triumph," and is of superior quality. In fact, no Pomelo which has been received by this Division surpasses in quality the California seedling. This is undoubtedly a very choice fruit, and worthy of general cultivation. The Pomelo, like its cousins, the orange and lemon, is possessed of marked medicinal qualities. It is chiefly valuable as a corrective of the stomach and digestive organs, and also as a tonic stimulant. A medical opinion from a widely quoted physician states: "The sharp stimulus of the grapefruit is the best thing to set the digestion in order for the day." Invalids find it the right thing to give tone to the system, and it is a sure preventative when partaken of freely for the enervation caused by climatic conditions. It possesses in a remarkable degree the virtues of quinine without producing any of its bad effects, and may be given with benefit in malarial fevers. Many use grapefruit as a relish with meals, and the appetite is sure to be quickened by it. For medicinal purposes the entire fruit may be cut up into slices upon which boiling water is poured, put into a pitcher and left to cool. A glass of this before meals and at bedtime will prove an excellent tonic. Grapefruit marmalade contains all the good qualities of this fruit in the form of a most delicious preserve

Probably no fruit of the citrus family has forced its way into the front rank of popular favor with more difficulty than the grapefruit or pomelo. Of East Indian origin, it is said to have found its way into Asia through the efforts of one Captain Shaddock, hence the name, shaddock, sometimes applied to it. From Asia it became diffused through the West Indies and later into Florida and California. At the close of the Civil war the writer embarked in the foreign fruit trade, and has watched with interest the trade growth of this once discarded, but now popular, fruit. So popular has it become that it is looked on now as almost a necessity, not only as a breakfast dish, but it appears on the menus as a first course at many state dinners and social functions, besides being highly recommended by leading physicians as a great relief for Bright's disease, rheumatism, constipation, malaria and many other kindred complaints, the acid of the grapefruit being so strongly impregnated with quinine properties as to serve as an excellent tonic and appetizer, besides working favorably on the kidneys more promptly than any other fruit acid. Even the rind of the grapefruit is said to produce an excellent tonic when boiled. While grapefruit is said to have its origin in the shaddock, it is evident that there are several varieties, for the shaddock as we know it is usually larger than the grapefruit, is mostly pear-shaped, thick-skinned, and when cut shows a pinkish color while the perfect grapefruit is round, thin-skinned and juicy, with a white pulp. Between the years 1860 and 1870 small quantities of grapefruit began to make their appearance in the New York market, coming there from the West Indies, mostly in schooners carrying Abico oranges, pineapples, conch shells, etc. So limited was the sale that seldom did a consignment realize expense charges, the grapefruit generally finding its way into the hands of vendors who loaded their wagons and hawked the fruit about the city calling the "California Oranges," "Forbidden Fruit," "Paradise Fruit," or using any name best suiting their sale. Several hundred barrels of this fruit was shipped from New York to England in the early 0's, but with no financial success. As Florida became a fruit-growing state, and careful attention was given to the cultivation of grapefruit, people began to appreciate the fruit, cultivation having improved its flavor, texture and shape, and in later years, as Florida became a Mecca for invalids and tourists, the grapefruit grew rapidly in favor. While Jamaica, Florida, Nassau, and California furnish us with our present supply, it is said that Cuba will shortly be quite a factor in this line, as thousands of young trees have recently been planted there of the best varieties, so that lovers of this health-giving fruit may feel assured of a never-ending supply."

SLIGHT INCREASE IN ORANGE ACREAGE.

A Riverside fruit grower in a interview in the Riverside Enterprise in speaking of the output for the coming year said:

"We hear a great deal almost every year about the increased acreage of oranges and how the crop will be much larger, but it does not always work out that way. Persons who talk about the increased acreage do not take into consideration that there is also considerable decrease each year and I think this decrease will almost offset the increase caused by new groves.

"The growth of all these towns out along the foothills and in the citrus belt is causing old groves to be cut out.

"Land that is covered by oranges is subdivided into lots or acreage, and the groves are cut out to make room for houses. Redlands is built right among the orange groves, and the expansion of the town necessarily crowds out the orange trees. The growth of Sierra Madre, Azusa, Pasadena, Alhambra and other towns is encroaching on the oranges.

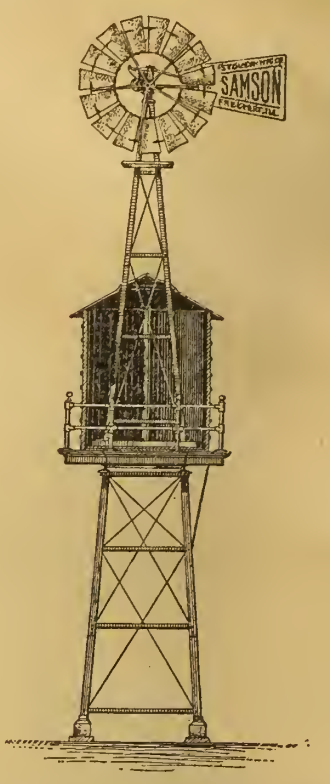
"So while new groves are coming into bearing each year, old ones are being cut out.

"Here is one significant fact, however. Almost all the new groves are valencias, while the ones that are cut out are navels or seedlings. Consequently, the production of summer oranges is constantly increasing while the navels are decreasing slightly in this section. Our summer shipments the past season were far larger than ever before, and I look for them to be still larger next summer.

"There is a fine demand for summer oranges up to a certain point. There is no danger of an overproduction of oranges as a whole, although if the increase is in valencias alone there may come a time when there will be an overproduction of that specific variety."

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Farm Names

INTEREST in the naming the ranch home is not manifested so much by the great number of names being received as by the tone of the letters which do come to this department. Plainly some of those who do write have been inspired to choose a name for the home place by this campaign of the Cultivator. Others are sending in names which have been given to their places for months or perhaps years. In any case the custom is growing and it is an admirable one.

Our first name this week comes from the northern part of the State. It is:

"Laurelwood," owner, B. W. McGrath, Cloverdale, Sonoma county. The name is sent in in the following catchy verse:

A Farm Name.

Since the dear old Cultivator
Has become an agitator,
  Seeking ever for its own subscribers, good;
And among its other branches
Calls for naming of our ranches,
  I will write to you while I am in the mood.

Our postal and railway station,
Also where we buy our ration,
  Is a little town that's known as Cloverdale.
It's a "daisy." It's the "candy."
I can tell you it's a "dandy,"
  It's a place where crops are never known to fail.

It is called the "Orange City,"
But that can't affect this ditty
  Since I thought that I would tell you if I could,
Of our ranch and why we name it,
So that others cannot claim it.
  From its natural surroundings, "Laurelwood."

The baylaurel grows upon it,
Worthy of a springtime sonnet,
  But I have to spend my time in chopping wood.
So my wife then named it Laurel,
And, lest we have cause to quarrel,
  Let me add my work—and call it "Laurelwood."

"Calazona Ranch," owner, F. S. Webster, El Centro, Imperial county. Mr. Webster writes:

I have read with pleasure the answers to your farm name request.

Every farm or ranch should have a distinguishing name in my judgment.

Every successful business enterprise or undertaking has a name to distinguish it from other ventures of like motive. If a ranch produces anything that the public needs, give the ranch a name, in order that the public may know where to go to get the product of the ranch. It's an advertisement, a trademark which properly handled means a great help financially to any farm.

We came to the Imperial Valley 5 years ago and have one-half section of the very best land in the valley.

We call our ranch the "Calazona Ranch." A combination of California and Arizona. Named thus because many years of our lives were spent in Arizona and for old times' sake we desire to keep alive the memories of friends there, and the wonderful things of that wonderful territory. Next to Arizona we cherish California our present home, and in honoring both we coin "Calazona."

We think the Cultivator the best farm paper printed in the west. It has been a constant visitor to the family for over 10 years.

"El Alamo," owner, C. H. Francis, Loomis, Placer county. In sending in the name Mr. Francis writes: "We have a large cottonwood tree and we wished to name the place to call attention to the fact, and also to give it a Spanish name. Hence the name, El Alamo. Is that proper? We wish the Cultivator success in this campaign for naming the ranch."

Alamo is Spanish for poplar and the cottonwood is of the poplar family hence we think your name entirely correct.

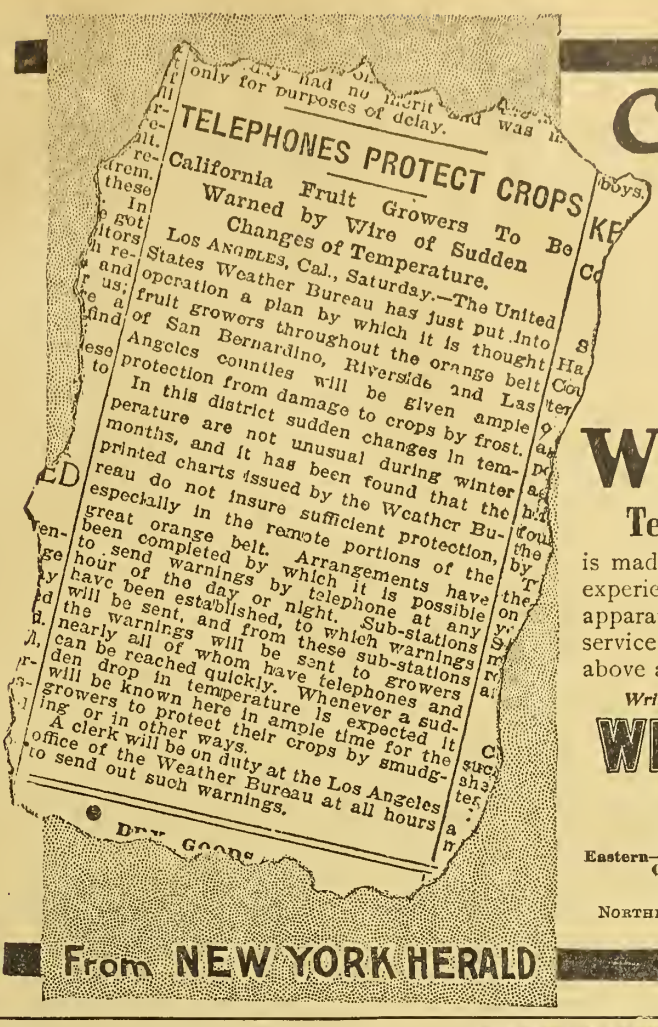
"Tereticornis Rancho," owner, Reverend L. D. Temple, Hemet, Riverside county. Mr. Temple writes from Upland but says his ranch is a 320 acre one, ten miles west from Hemet on the main highway from Hemet to Riverside. Regarding the occasion for naming the ranch Tereticornis, he writes:

Last spring I set out 800 Eucalyptus tereticornis as an experiment. They were set March 15 and were about six inches high. They have had no irrigation and scarcely any rain. They have been kept free from weeds, and have been cultivated once a month or oftener. On September 14, I found specimens 5½ feet tall, and all were making a fine growth, thus proving that this variety of eucalyptus will grow from the start without irrigation and with slight rainfall. My land has no sub-irrigation. I am intending to set 1000 just as soon as the ground is wet to the depth of one foot as a further experiment to determine whether fall or spring setting is the better. I have engaged 8000 Tereticornis for planting in April.

I set several varieties last spring for comparison—rudis, polyanthema, corynocalyx and rostrata. The tereticornis excels them all in beauty, vigor and rapidity of growth. I shall therefore keep on planting this variety and have named my ranch as above stated. I inclose a photograph of a specimen tree 5½ feet high six months from planting with no irrigation and almost no rain.

Enclosed in Mr. Temple's letter is the photograph of tereticornis trees and it shows remarkable growth.

"Ward's Fruit Ranch," owner, Nelson Ward, Compton, Los Angeles county. Mr. Ward's ranch is two miles south east of Compton and is principally devoted to the production of high grade apples.



Crop Insurance

The telephone is a great protection against loss on crops due to sudden weather changes. It enables the farmer to obtain at any time the latest weather forecast fresh from his nearest station. Likewise, the telephone protects against loss through sudden market changes and enables the farmer to sell when prices are best.

250 East Fifth St., Los Angeles, Cal.

"Muscatel Orchard," owner, Mrs. J. B. Leininger, Fresno, Fresno county. Mrs. Leininger writes: "We are delighted with the Cultivator and always show it to our neighbors. We have named our 30 acre ranch "Muscatel Orchard' because Muscatel is our nearest station. The Southern Pacific railroad passes over one corner of our ranch. Principal productions are Muir and Alberta peaches and Malaga grapes."

"The Poplars," owner, D. D. Palmer, Modesto, Stanislaus county. Mr. Palmer writes that the large number of poplars on the place is the occasion of choosing this name. He says these trees are grown largely in that section because of their quick growth and their shade and their value as posts and fuel.

In addition Mrs. Rafael Lanini, a subscriber from Humboldt county, comes for a suggestion for a ranch name and sends in the following letter:

"What name would you suggest for a ranch of over one nundred acres? We do not own this place but have it under a ten years' lease. We dairy forty-seven cows. Are having a new cottage built, and the cottage sets on the bank of Seven Mile slough, fringed with green willows.

"I wanted to call the place either 'Willow Brook Ranch,' 'Meadow Brook Home,' 'Mossy Bank Cottage,' 'White Clover Ranch,' and am not decided on a name, so thought to come to you for help. I prefer either Mossy Bank Cottage or Meadow Brook Home to any of the other names. This ranch is situated in the fertile Eel River valley and grows green clover all the year round."

It is hard indeed to comply with the subscriber's request, at least to go farther than to make suggestions. Naming the ranch, like naming the baby, is a matter of personal preference and in this case where one lives upon it and takes pleasure in referring to its name, that which appeals strongest to the family directly concerned

Continued on Page 359

Fruit Trees Require Food

You cannot expect a full yield of rich milk from a half-starved cow.

Neither can you get a bountiful yield of fine, full-flavored, sound fruit from trees not properly nourished with

POTASH

The soil should be enriched with a commercial fertilizer containing a good percentage of Potash. The proper proportion is from 9 to 12 per cent., according to requirements.

The experience of successful fruit-growers proves that Potash, supplied in proper proportions, causes the trees to grow more sturdy and vigorous—better able to resist disease. The fruit grows larger, sounder, finer-flavored, and ripens earlier.

POTASH

Send for free book on Fertilizing, prepared by practical experts, and of great value to the fruit-grower.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

Deciduous Fruit Culture

CROPS BETWEEN TREES.

A FRIEND who has an unprofitable apricot orchard on a fine sandy loam came to us and asked for an opinion on the proposition of planting a strip of alfalfa between the rows eight feet wide, leaving the trees in a strip of cultivated land sixteen feet wide. This man has an abundant water supply. Under these conditions it is a good proposition to plant alfalfa among the trees as described. Without water it would not do. The alfalfa would no doubt bring more one year with another than the apricots and he would perhaps wind up with planting the whole orchard in alfalfa, as we have known to happen.

One time a fruit grower of Cucamonga planted alfalfa in his Moorpark apricot orchard, which has never paid for the cultivation. He had an abundance of water and soaked the orchard well, and to his surprise the apricots bore heavy crops of fine fruit that sold for the top price in the market.

The alfalfa was a paying proposition alone, and the apricots were extra.

An orange grower at East Highland tried the experiment on his orange grove, there being some hard, tight soil into which the roots and water penetrated with difficulty. There were two plantings, one early in the winter and one late. The grove was furrowed out for irrigation and water was run as often as necessary, without subsequent cultivation, of course. The alfalfa was mowed during the summer and left as a mulch, which, with the growing crop, completely covered the surface. We had the pleasure of seeing it early in the summer and also late in the season. The alfalfa was grown in this grove because the trees had failed to produce satisfactory crops. There was at the time a fair crop of fruit of good quality on the trees. What the final results of this experiment proved we are not aware of, but the grower has promised to inform our readers when he is sure about it himself.

As a general proposition, it is not good policy to grow crops between trees on a large scale, for the reason that there is a certain depletion of the soil that is not returned in most cases. In small plantations it is different, as fertilizers are easily and more cheaply applied. A man with ten acres will have stable manure from his own place for part of it and it is no big item to purchase enough for the balance, whereas if he has a hundred acres or more he will need to make fertilization a special business and growing intercrops will complicate it.

There are exceptions, as in the case of legumes, where it is well known that they add fertility to the soil through their utilizing atmospheric nitrogen in addition to adding humus to the soil, as any vegetable does. When sufficient moisture is always present for both trees and intercrops, there can be no great loss to the trees except they be citrus. It is, however, sometimes necessary for persons of moderate means to utilize the spaces between the trees to procure an income to tide them over till the trees come into bearing.

The injury brought about by growing intercrops is illustrated in the English walnut grove north of the Southern Pacific tracks at Bassett in Los Angeles county. Intercrops of cabbage and potatoes were grown for several years in that grove, much to their detriment. Both trees and annual crops suffered at times for water and neither proved very satisfactory.

Among the bean growers along the Ventura and Santa Barbara coasts, walnut groves in which beans are grown do not produce as fine nuts as the groves that were given clean culture. These conditions were noticeable where no irrigation was practiced.—J. W. Mills, Marysville.

GRAVENSTEIN APPLES AT FORESTVILLE.

The oldest tree in this orchard was planted by L. Harbine 43 years ago and from it were picked this last season 47 boxes and 50 per cent of them 4 tiers. After its 43 years of service the tree is yet thrifty and well balanced. This fine orchard is the property of H. R. Harbine of Forestville, Sonoma County.

The tax rate of Butte county, fixed for the coming year, is $2.05; Placer county, $1.85; Glenn, $2.25; Siskiyou, $1.45 (the lowest in its history;) Tehama, $1.60; Trinity, $2.25; Yuba, $2.70.

Irrigation and Forestry

DISASTROUS CONSEQUENCES ILLUSTRATED.

THE disastrous consequences of destroying forests in mountains and wooded regions in which streams have their sources have been illustrated by the results of the recent floods in Georgia and the Carolinas. When mountains and hill sections are forest-covered, the rainfalls, however heavy, swell the streams gradually and give them a fairly equable flow. They seldom rise so as to become destructive of property and a peril to life. But cut off the woods and leave great bare spaces of rock and exposed soil, and when an unusual storm comes torrents sweep down, overflow the land, ruin crops, submerge villages and cause disastrous loss and misery to thousands.

The precise extent to which these Southern floods are to be attributed to indiscriminate lumbering and the destruction of forests in the Appalachain Mountain region it is impossible to ascertain or to estimate, but this may have made all the difference between the excess of water flowing harmlessly away through moderately swollen streams and rising suddenly and swiftly into an uncontrollable and destructive flood. The loss of property is reckoned in millions of dollars and the suffering and privation are not to be computed in figures. Aside from this, the spasmodic and irregular flow of streams all through the year as the result of forest devastation interferes seriously with their utility for water power.

Whatever the exact relation between these Southern floods and forest destruction the general fact is indisputable that the denuding of mountain ridges and cutting away the woods about our river sources has done and is doing incalculable damage to the country. It is an injury against which the people cannot protect themselves by individual effort. They must act collectively through their Legislature and governmental authorities. They must act in their several states, but the interests affected are not confined within state boundaries and some of the measures necessary do not come within State jurisdiction. A National policy of forest preservation is at least as important as that of irrigation of arid lands and the reclamation of swamp regions.—San Jose Times.

DAY OR NIGHT IRRIGATION.

The furrow system comes as near the ideal as any in use. It conveys water to the roots without compacting the surface soil to any great extent thus leaving it in fairly good condition to retain moisture. It does not tend to bring the alkali to the surface quite as much as flooding does. When once installed on a field and spouts or tubes are placed in the ditch banks but little attention is required and the cost of irrigation is small. Keeping the soil saturated with water to the exclusion of air for any length of time is injurious, so it is best to irrigate as quickly as possible, which may be done by making the furrows of reasonable length. Three hundred feet is generally long enough.

When the furrows are very long the upper part of the field has received too much moisture by the time the lower is done. When furrows are run lengthwise of a slope there is much trouble in keeping them from breaking. It is desirable to have the furrows at right angles to the head ditches and the laterals square with the world when ever the conformation of the ground permits it. The furrow system may be used for all crops. Alfalfa, however, is well adapted to free flooding when well established, but it is advisable to use furrows the first year. These will facilitate an even distribution of the water although flooding is practiced after the stand has been secured.

The chief objection to flooding is the greater cost of irrigation and the difficulty of irrigating well at night. It also compacts the surface soil and favors excessive evaporation and the rise of alkali, although the shading of the ground by crops to some extent offsets this. There are two stages in the growth of wheat and oats when an abundance of water is required—at time of jointing or sending up of stems and just before blooming. Large amounts of water tend to increase the starch content of wheat, while as the amount of water is decreased a large per cent of protein is formed. Irrigation water is warmest in the afternoon and does not become cold until several hours after sundown.

The subsoil, or that part of the soil where most of the roots are, becomes warm towards evening and retains its heat pretty well into the night. In fact, it is coldest at noon and warmest at midnight. In view of these facts, it is best in irrigating tender things to turn on the water late in the afternoon and allow it to run during the forepart of the night. It is claimed by some farmers that night irrigation gives better results even with field crops. The difference, if any, can be but slight. In practice, when water is turned on a field of grain or alfalfa, it is kept running day and night and shifted from one section of the field to another until the whole field has been irrigated, and this is the most expeditious way of irrigating ordinary crops. Day irrigation permits of better regulation and distribution of water. The evaporation is less at night and water percolates to a slight degree faster when the soil is cold than when it is warm. —Denver Field and Farm.

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

Small Fruits and Vegetables

JERUSALEM ARTICHOKES.

THERE are two kinds of artichokes. The true artichoke is known as the French or globe artichoke, and the other as the Jerusalem artichoke, writes Prof. Berry of Washington, in The Farmer. In appearance the French artichoke resembles the common bull thistle. The flower buds only are used. The term "Jerusalem," as applied to the other artichoke, is a corruption for the Italian name for sunflower, and the term "artichoke" was given to this plant because of the similarity of flavor of the tuber to that of the true artichoke. In this country only the Jerusalem artichoke is grown and only this species will be discussed in the following lines.

The Jerusalem artichoke is grown almost exclusively for its roots or tubers. These resemble the potato, but are not so smooth and are generally pear-shaped. The leaves and stems are occasionally used for rough forage or silage, but if used thus they must be cut early in the season as they soon become too woody for food. Years ago artichokes were used to a small extent for human consumption, but their place in that respect has been taken by potatoes.

There are red, white, yellow and purple varieties, but in this country the red and white Brazilian varieties have given the best results. The chemical composition of Jerusalem artichokes indicates that they have about the same feeding value as potatoes and that they are superior to turnips and rutabagas. They are richer in protein but poorer in carbohydrates—starch and sugar—than sweet potatoes. The tubers are used almost exclusively for hog food, but there is no reason why they could not be used for dairy cows, the same as other roots. They do not seem to have the same succulence as other roots and are, on the whole, not as desirable for cows as other roots. Some trouble may occasionally arise in pursuading hogs to eat raw tubers, but taste for them is soon acquired.

Hogs will not thrive on artichokes alone, but grain should be made a part of the ration. It has been found that about five pounds of grain are required to produce a pound of pork, but when artichokes are fed only about three pounds of grain are required for the same gain. Artichokes, therefore, have a feeding value equal to two pounds of grain for each pound of gain in pork. The tops, if cut at the proper time, compare favorably in feeding value with green corn fodder.

Jerusalem artichokes will do well on almost any kind of soil, providing it is well drained. They will do well on poor soil. They will withstand drouth, and this makes them particularly adapted to the semi-arid west. They have done well for farmers near Connell, Wash.

Like the potato, the artichoke usually fails to produce seed. It is generally propagated by tubers. It is best to plant whole tubers, though cuttings with two or more eyes each may be used. They require more room than potatoes and should be planted either in hills not less than three feet apart each way or in wider rows, and 18 inches apart in the rows. They should be planted early in the spring, as they require a long growing season (five months.) They stand frost better than potatoes. If necessary, and conditions permit, they may be planted in the fall, or even in the winter. About four inches is deep enough to plant.

Artichokes should be cultivated like potatoes, but cultivation may cease when the tops are about two feet high.

Harvesting is nearly always done by the hogs, which will root out the tubers for themselves. If for other use, they are harvested like potatoes, They may be left in the ground over winter without harm. They will stand freezing in the ground, but not out of it. If stored over winter they should be handled like potatoes.

The yield of artichokes is greater than of potatoes. In Oregon 500 bushels per acre were secured. Near Pullman 740 bushels per acre were raised. A Connell farmer reports an excellent yield, which, however, was not measured.

The only danger which may arise from growing this crop is that it may become a weed. The roots live in the ground and continue to grow until harvested. There is not much to fear from this source, as the hogs will root them out thoroughly. They will not spread rapidly and are easily killed.

It is not likely that a large acreage will ever be devoted to artichokes, but to those who raise hogs, they may be a valuable adjunct to the ration. A few acres would probably prove profitable to hog raisers, especially since they yield heavily, require little cultivation while growing and are no labor to harvest.

Seed or tubers may be secured from any seedman who advertises in the columns of the Cultivator. It might be well to secure a few tubers from a neighboring farmer, if any have them. The yield from these could be harvested and the entire crop used for seed the second year.

SEAWEED AS MANURE.

The following appeared in a recent Estate Magazine published at Laudon, England. It has a value to a few of Cultivator readers who may be situated near the coast:

"Seaweed contains from 4 to 20 per cent. of potash as its chief manurial ingredient, and sufficient nitrogen and phosphates to make it a fair all-round manure. Some kinds yield an appreciable quantity of nitrogen, whilst others are very poor in this regard. However, the potash is the chief consideration, and it is this that makes seaweed a good manure for potatoes and mangels, whilst it also encourages the clovers and finer grasses in pastures. In addition to this, the organic material which it adds to the soil is of no small value, particularly on light land. The matter is not experimental, as seaweed has been used from very early times by the small crofters of the western coasts of Ireland and Scotland for their oats and potatoes. Their plan is to collect it as soon as possible after it is thrown up, and plough it in fresh at the rate of twenty to thirty tons per acre. In the Channel Islands, too, seaweed is valued as a manure. The rich pastures are top-dressed with it, and it is used for mangels and other roots, sometimes in conjunction with farmyard manure. The chief point in using it is to cart and plough in the weed whilst quite fresh, as it decomposes very quickly, greatly reducing in bulk and losing much of its nitrogen. For this reason and because of its bulk it is available only on farms near the shore, and there it might certainly be more extensively used. As its use gives good results in some districts, there is no reason why it should fail to do so in others."

The Ornamental Garden

INDEBTED TO CALIFORNIA.

IN a recent newspaper interview, Eugene Germain of Los Angeles spoke regarding California's native plants as follows:

Few people realize it, nevertheless it is a fact that the horticultural world is indebted to California for many of its most valuable plants. First and foremost may be mentioned the ever popular California poppy (Eschscholtzia Callfornica), or Copa de Oro, "Cup of Gold," as it was termed in early days by the Spanish. This flower is almost as eagerly sought after and prized by ourselves as by the tourists who visit our city. In cultivation there are as many as eight distinct varieties of it, including the yellow, orange, orange and yellow, white, pink, a semi-double form of the white and yellow, and last of all, the variety introduced by Mr. Burbank, which is a deep rose color.

Then there is the Matilija poppy (Romneya Coulteri) with its immense blooms, often seven inches across, of purest white with yellow centers. It often has been termed the "Queen of California" flowers, and surely is deserving of this title, for it has no rival. This plant has been largely cultivated in England and other countries, and is in great favor.

The Spanish Dagger (Yucca Whipplei) is truly a magnificent flower, raising its immense stem eight to twelve feet in the air, with flower spikes four and six feet long, composed of hundreds of large, creamy white flowers. There is something grand about these plants when in flower in early summer, as they stand like so many sentinels stationed on our hills.

Another flower which must be mentioned is the scarlet larkspur (Delphinium cardinale), with its long spikes of vivid scarlet flowers.

Bartonia ourea (blazing star) is a flower also much cultivated in Europe, but a native of our state. It has large, rich, golden-yellow flowers, almost as large as a poppy.

Two lilies of which we may be justly proud are Lilium Humboldti, the native tiger lily, a stately plant growing to a height or four or five feet, with large orange-colored flowers, spotted with maroon, and Lilium Parryi, which has lemon-yellow fragrant blossoms.

The baby blue eyes (Nemophila insignis) must not be forgotten, with its delicate sky-blue flowers.

The lupins, godetias, clarkias, gilas, collinsia and a great many more are all members of our flora, but space will not permit of their mention in detail.

WORK WITH ROSES.

EVERBLOOMING roses should be at their best during the fall months.

Tea-roses must be fed liberally: old, rotted cow-manure is best, but bone meal is good.

Dig several big spoonfuls of fertilizer about the roots of each rose plant this month, replacing the mulch.

Cut back the blooming branches as soon as the flowers fade; work the soil under them and give a good soaking with manure-water and you will have abundant bloom.

Sharp pruning and good feeding is the sure means of getting fall roses. Keep down all insect pests with spray, tobacco-soap or whale-oil soap.

A tendency to blight of buds at this season means insects at the roots. Dissolve a peck of fresh lime in a barrel of water and give the ground a good soaking with the solution, using only the clear water on top.

When pruning the roses, use all cuttings four or five inches long for rooting. Insert the cuttings in well worked soil, leaving one eye above the surface, firm the earth about them, give a good soaking, and turn over them a glass fruit jar, pressing it into the ground. Draw the soil up around the jar, but not over it, keep the ground moist, and leave until spring.

Rose cuttings may be rooted in moist sand in any warm place, but the sand must not be allowed to dry out at any time. When the rootlets are half an inch long, transplant to soil, and give good care.

Most cuttings consist of three or four joints, or eyes, with a healthy leaf at the top. Discard every cutting that does not hold the leaf until the plant begins to grow, as the falling of this leaf means a delicate plant, even if it lives and roots.—American Farm World.

WHEN AND HOW TO REPOT FERNS.

Your ferns, to be at their best next winter, should be repotted now. About two inches increase in the diameter of the pot is required. A compost can be secured from the florist or made at home.

A good garden soil mixed with barnyard or commercial fertilizer is all that is needed. Too little of the fertilizer is better than too much, which will burn the roots.

Broken bits of crockery must be placed over the hole in the bottom of the pot. Three inches of dirt is then placed over this and leveled ready for the plant.

In removing the plant from the old pot, care should be taken that the roots are not injured. To avoid this strike the sides of the pot lightly but firmly with a trowel. Then place the pot on the side and, holding the plant with the left hand, strike the edge with the trowel. A sharp blow on the edge should cause the soil and roots to come out together. The mold is placed at once in the new pot and given a thorough wetting.

The new compost is then put in around it until the pot is filled. It must be remembered that the plant should always be placed an inch deeper in the soil. The day after repotting, the plant should be kept away from the sun.

If ferns are planted in the garden now, cut off all the fronds to prevent evaporation.

Ferns should be planted in early spring or early autumn when not in growth, but may be planted in summer if properly pruned.—American Farm World.

BULBS.

The Morris & Snow Seed Company have in press a circular on the growing and caring for bulbs which will be ready for sending their patrons in a short time. This firm is making a large business of bulbs for fall planting and has found the business benefited by sending out these circulars with instructions regarding their care. The company is now located at their new quarters at 425 South Main, Los Angeles, which is more central and also much larger quarters than those formerly occupied by them at 555 South Main.

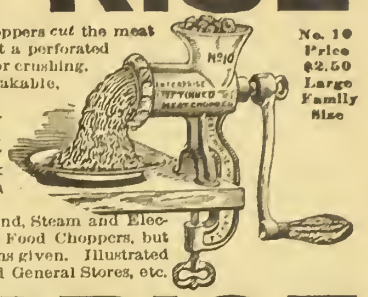
ENTERPRISE

Meat and Food Chopper

"Enterprise" Meat and Food Choppers cut the meat with a revolving steel knife against a perforated steel cutting plate without tearing or crushing. Easily cleaned. Practically unbreakable, and will last for years.

The No. 5 "Enterprise" Chopper costs only $1.75. No. 10, shown in cut, $2.50. They are standard family sizes, and not only save half the work at butchering time, but are useful in the kitchen every day in the year.

Made in 45 sizes and styles for Hand, Steam and Electric Power. We also make cheaper Food Choppers, but recommend the above for the reasons given. Illustrated catalog free. Sold at Hardware and General Stores, etc.



No. 10 Price $2.50 Large Family Size

ENTERPRISE

Sausage Stuffer and Lard Press

Lessens the labor at butchering time. Two machines in one. Well made and does its work quickly and surely. Cylinder is bored true and plate fits accurately. Pressure cannot cause meat to rise above the plate. The Patented Corrugated spout prevents air from entering casing, ensuring perfect filling and preservation of sausage.

Machine can be changed into a *Lard Press* in a minute's time. Can also be used as a Fruit Press.

Your dealer should be able to supply you with the "Enterprise" Sausage Stuffer and Lard Press. If not, order direct of makers.

No. 25—4 quart Japanned Price $5.50 4 sizes Tinned and Japanned

ENTERPRISE

Bone, Shell and Corn Mill

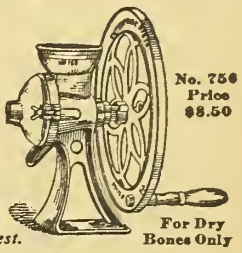
The "Enterprise" Bone, Shell and Corn Mill is a good, general mill for farmers, poultrymen, etc., and for compactness, strength and durability is unexcelled. Handy for grinding poultry food and making bone meal fertilizer. Mill shown in cut $8.50, weight 60 lbs., grinds 1¼ bu. corn per hour. Look for the name "Enterprise" on the machine you buy.

Grind up dry bones, oyster and other shells, corn, etc., for your hens and watch results.

Other famous "Enterprise" household specialties are: Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, Etc., Etc.

Sold at Hardware and General Stores, etc.

Write for "The Enterprising Housekeeper," a book of 200 choice recipes and kitchen helps. Free on request.



No. 750 Price $8.50

MILK SUPPLY.

THE advance of medicine along the lines of knowledge in germ disease during the past twenty years has given control of many of the worse scourges of the human family. Then it was that the attention was called to bovine tuberculosis. While there is no doubt that much has been made of the consumption scare to bring gain to grafters, yet it will all result in good. There are other troubles needing attention as well as tuberculosis. The school authorities are, at last, awakening to the control of eye trouble, introduced by the Orientals into California. It is time that it was attended to, for we do not want our children to have the peculiar eyelids and lashes of the Chinese. So it is with a host of other troubles, Cuban itch, for instance, has prevailed in the cheap lodging-houses and made life a burden to many cleanly people.

Dr. Bangs.

There comes as a delegate from Denmark to Washington, to attend the Tuberculosis Congress, a man in whom the dairy world is greatly interested—Dr. Bangs. He has a paper written in layman style on "Studies in Animal Tuberculosis and What We May Learn From it as Regards Human Tuberculosis." Dr. Bangs, nearly fifteen years ago, brought the positive proof that animal tuberculosis in cows was not inherited. That it was contracted the same as any other diseases. Then he originated the system known as "Bangs" of eradicating it from a herd of pure bred cows without destroying the herd. The herd is first tested and all reacting cows separated, the stables are disinfected and only the healthy cows put into them. The rest of the herd, that is the reacting cows, are segregated, having different milkers and pails. When they drop a calf it is at once removed and never allowed to nurse. The milk from the diseased herd is pasteurized and used in feeding calves or pigs. The temperature to which it is raised should not be less than 175 degrees, this renders the milk safe, Dr. Bangs has found, for feeding and domestic use.

Tuberculin.

The wonders of tuberculin never cease to appeal to me like a romance. The milkers think it is magic and are quite superstitious over it. Take a vial of yellow-brown fluid and inject a small portion of it into the shoulders of a couple of cows. To all appearance the cows are equally fat and sleek; no one would ever suspect either of them of being diseased. Yet in a few hours one has reacted and is condemned, while the other one is passed as healthy. Stranger yet, of two animals one may react with great severity and the other very lightly, the first one, if killed, will show a mild form of disease, while the other one that acted lightly will be fairly dropping to pieces. I saw a cow that had the disease pronouncedly, but so thoroughly was her system saturated with the poison, that the injectiug of a little more did not matter and no reaction took place.

BALBOY, 44,597.

A Madera County product, a registered Percheron stallion, property of T. S. Osborn, Madera, California. Mr. Osborn has a fine 300 acre stock ranch and now has 125 mares and colts of Percheron breeding.

Pasteurized Milk.

In the United States we are drinkers of raw milk. We will not be educated to like cooked milk, that is the older generation will not. The babies are being raised on it largely. I look to see, in ten or twenty years, a taste formed for it. This is not impossible for it is not nearly so disagreeable as beer to the taste. The whole German people like beer because they are raised to drink it from childhood. I do not believe you can take many grown-up people that never drank beer and get them to say they like it. Now a taste for boiled milk is not impossible to create in this way by giving it to children.

Sanitary Milk.

Nathan Strauss of New York has said in a recent speech, made in Germany, that he looked forward to the time when the pasteurizing of milk of cities would be part of the municipal duty, the same as a pure water supply. Great as Mr. Strauss's good work has been in furnishing pasteurized milk to the slum babies of New York, yet, when he claims that pasteurizing of milk has reduced the death rate of slum children fifty per cent., the claim is too great. There are other causes than milk for the death of children. The milk comes from the country and the country

children drink of it and escape troubles. Over crowding in the houses and other bad food has much to do with destroying children.

Dairyman Duty.

The dairyman rises from being the humble server of the people to being a conserver of their health. His simple little duty is being clean and then, after everything is as clean as he can make it, go all over it again for safety. The dairyman, with a large herd, is more likely to furnish healthy milk to the consumer than the man with one or two cows. The very size of the money proposition, the money invested, makes the man with many cows very careful about his feeding, watering and stables. The cow's health is gain. The dairy that is large enough to have a steam boiler can be cleaner than it is possible to scrub cans, floor or utensils. The sterilization by steam is a complete one and the only one to be applied to milking pails, cream cans and separator. Why? Because the creamery using separated cream does not have the cream grow slimy or the butter fail to come. There is no bacterial growth possible where things are steamed. The buyer of milk should buy of the regular milk men if they wish clean milk, rather than from the neighbor's cow that is all right in herself, but where the cans may be all wrong.—M. E. Sherman.

DAIRYMEN

Your cows are either making money for you or eating their heads off.

Figure it out. Would it not pay to use less of high cost fodders and more sugar-beet-pulp at the low price of 50 cents per ton?

If it is milk you want you will get your money back with profit, besides you will improve the condition of the animals.

And don't wait too long before arranging to silo some of it for use after the factory closes down.

Write, Los Alamitos Sugar Company, Los Alamitos.

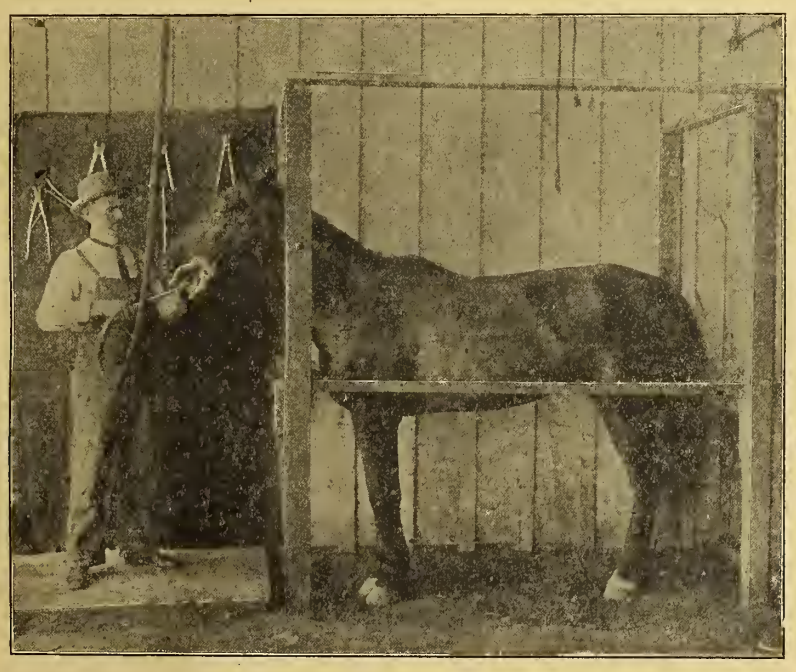
A VETERINARY HOSPITAL.

In these modern days specialists are given an advantage over those who distribute their energies over a broader field. For dealing with the ailments of human beings there are not only hospitals but physicians who make a life study of one particular line in those hospitals. For horses and dogs and others of our dumb servants, such perfection can hardly be expected and many may be surprised even to know that any hospital at all exists for their treatment. But every city of any size now has veterinary hospitals and the city of Los Angeles maintains as a part of its municipal machinery a regularly equipped horse ambulance in which diseased or injured horses may be placed and taken to hospital for treatment

The writer recently had the pleasure of visiting one of these hospitals and observing the up-to-date methods supplied for alleviating the suffering of horses, cattle, dogs and even cats.

This was the veterinary hospital belonging to Dr. R. T. Whittlesey, who answers the veterinary questions in the Cultivator. This place is put up with modern appliances for handling the animals and with liberal use of concrete in floors and walls is made practically as sanitary as hospitals for the treatment of human beings. The concrete floor has gutters leading to pipes carrying all matter to the sewer and these floors are flushed often to keep away all suggestions of odors.

The operating table is not wanting,



for in a room at one side is an immense table on which a horse may be placed for treatment. The horse is led alongside the table and securely strapped to it, when with a worm gear an attendant lifts the entire table top which takes the horse from its feet and carries it over on its side. It is then so securely strapped that any operation may be performed without any danger to physician or attendant. It must not, however, be assumed that the horse is tortured unduly for anaesthetics are almost as common in animal practice as with human beings. A table for dogs in which the animal may be strapped and held in any position is also a feature.

The engraving given on this page is taken to show the use of the rotary electric dental machine, an invention of Dr. Whittlesey. It is similar to the dental machine used in practice on humans. The appliance which may be observed in the engraving which holds the mouth of the horse open without any inconvenience to it is for protection of the operator and his machine.

A material factor in Dr. Whittlesey's practise is his Chinese trade. Many horses from the Chinese gardeners who make no effort to doctor their own horses are brought to the hospital for treatment. To secure this trade the doctor has issued a circular in the Chinese language. The veterinary hospital is an interesting place to visit and is the means of saving many horses and alleviating the sufferings of more.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 358, 359.

IS THE SMALL FARMER DOOMED?

At the Whittier Institute held last spring at the time of the opening of the Pathological Laboratory, Mr. Reed, of Riverside, referred with much regret to the fact that the small orange grower of California was not, as a general thing, showing the intelligence in growing or bringing to market his product which the owner of the large orchard usually shows. The owner of the large orchard is often a syndicate, sometimes an Eastern capitalist, employing skilled superintendents to conduct the property along business lines. In line with true business principles these superintendents have put the orchards in their control on such a high grade producing basis and then have marketed with such intelligence that these orchards are proving far more profitable than the ones conducted by the small home owner. Mr. Reed then asked the question seriously, "Does this mean that within a very few years our small homecrofters are to give way to the larger estates?" Time only can answer his question but unless our small farmers awake to the necessity of their thorough mastering of the cultural problems we fear the tendency will be more and more to the large holdings.

We say we fear it because we do not think it will be for the best interests of the country that such a condition should be brought about. Certainly the independence with which the small farmer may conduct his little farm and the class of people who usually are drawn to that method of living are such that we believe the best interests of the nation would not be conserved if this condition should cease. In other words to quote an Eastern Exchange, "The United States is not suffering today because of the smallness of its farms nearly so much as on account of the smallness of our comprehension as farmers. The smallest farm is yet challenging the understanding of the scientist, the economist, the college, and the farmer."

INTERNATIONAL INSTITUTE.

After many years of effort and many rebuffs, Mr. David Lubin of Sacramento must have great pleasure in the near approach of the realization of his dream for a congress or institute, in which representatives of practically all the nations of the earth gather to discuss agricultural problems. The United States stands almost alone in gathering, publishing and disseminating a fund of information regarding the condition of crops and amount of output. Should this work be done by individual states it would be an aggregation of misinformation, rather than of information. That is, there would be no unity of method which would make the knowledge of value. The same would be true, should independent nations gather together as complete information as does the United States, were there not some provision made for some clearing house arrangement, whereby the various lines of information could be brought into harmony.

A noted English dealer in referring to the importance of the Institute said:

"The project is one of supreme importance to the commercial and industrial world. At the present time there are no reliable beacons to guide those engaged in the trade and manufacture of agricultural products, and merchants and manufacturers are, consequently, subjected from day to day and from hour to hour to fluctuations, oftentimes violent, in the prices of raw materials brought about by contradictory and unreliable reports emanating from interested or ill-informed sources.

"I need not tell you, who are so familiar with American agricultural reports, of the immense importance that is attached to the monthly reports (imperfect as they are) issued by the United States Government. For days before these reports are published it is common to hear merchants say:

"'We will do nothing till we hear what the bureau report is.'

"You can easily imagine with what intense interest the whole business world would await the reports of the international institute.

"It is of the highest importance that every one charged with the administration and direction of the institute should be an expert in some branch or other of the institute's work, and that those who are responsible for the publication of the reports should be trustworthy to the highest degree. Any leakage or premature publication of the information would inevitably ruin the institute's reputation."

GREEN MANURING.

One of the most expensive factors in growing a crop is the maintaining and increasing of the soil fertility. As expensive as it is, it is essential to the best results. The cost of irrigation, cultivation and general maintenance are practically the same on poor soil as on that which has abundance of the necessary elements and is in the best of mechanical condition. How to secure this fertility at the lowest possible cost has been a mooted question for years and will doubtless continue with as much diversity of opinion as it has in the past. However, on one point there is almost unanimous opinion, and that is that the securing of nitrogen and the making available of other plant foods locked up in the minerals of the soil, besides the bettering of the mechanical conditions, are all facilitated by the plowing of a green manuring crop. Whatever theories one may have in this matter some remarkable examples of success have been secured by those who follow green manuring which are sufficient to convince the most skeptical. Formerly many claimed that only that which was taken from the soil is returned. If for the sake of argument we may admit that for the moment, in that case the effect upon the mechanical condition of the soil is such that even if the same elements are returned to the roots of the trees they seem to be in a more available and acceptable condition, the ground has secured the addition of a supply of humus which retains moisture better than formerly, the "putty-like" condition has been broken up and the irrigator finds his soil takes in water better.

But we have a very decided belief which is now generally accepted as a fact that while the potash and phosphoric acid which was used is only returned in a somewhat more available form, an additional supply of nitrogen has been secured from the atmosphere. This may be in small quantities but sufficient to encourage further planting of green manure crops for the sake of the addition of this one element if for no other advantages.

MORE COMFORTABLE HOMES.

More and more comfortable homes with well kept and attractive spaces for lawns, with liberal displays of flowers and shrubbery, are appearing in California rural life. The wide veranda with its swinging hammock and even more comfortable places for the "hands" are more general. This is not imaginative, but will be noticed by any observant person driving along California roadways which every year become more attractive. This indicates two things, first, the prosperity of California farmers has developed the means of securing more than mere bread and butter, and besides the taste for better things has been encouraged until it, too, has become more discriminating. This is gratifying to all and especially satisfactory to the farmer who is the most benefited by it. May it continue and may every owner of a rural home in California demand for himself and his family such betterment to as large a degree as possible to command.

The Pasadena Gardeners' Association is arranging for its first annual flower show to be held in Pasadena on October 22, 23 and 24. Some fear this will be a little early to secure the best of showing from chrysanthemums and some other fall flowers, but the Pasadena gardeners will no doubt make a magnificent exhibit.

Shop Talk

CLUB RATES FOR 1909.—As was done a year ago, the **Cultivator** will in a short time present some very attractive clubbing combinations for the benefit of subscribers. Inquiries have already been received regarding our plans along this line for the coming season, and we take this opportunity of saying that it will pay to watch carefully the "Shop Talk" column in the near future for particulars. Arrangements are now being perfected whereby very attractive prices will be offered on clubs of not less than two magazines when ordered with the **Cultivator.**

It is our intention to include in our list the best and most popular magazines published and there is every reason why **Cultivator** readers should take advantage of the opportunity when offered. We wish to say also that we are in position to order any publication, whether advertised or not, and will gladly answer all inquiries. Keep it in mind and place your orders through the **Cultivator.**

"I like the Cultivator. Its articles, not too pedantic for the general reader, yet always promoting scientific agriculture, are the leaven urging us to better things. It does not devote its pages to telling how $5 in time can be spent in constructing a makeshift to save a dollar. A long and useful life to you." W. R. Livingston, Oxnard.

L. L. Wilcox, Julian, says: "Your publication is worth many times the price. You are surely filling a great want."

"The Cultivator should be in every farmer's home in the state." W. A. Ross, Anaheim.

Agricultural Notes of the Pacific Coast

Northern California

Humboldt county's tax rate will be $1.90.

Grape growers of Biggs are considering the building of a co-operative winery.

The Mendocino county tax rate is fixed at $1.85, which is 5 cents less than last year.

The creamery at Livermore, Alameda county, has closed because of lack of milk supplies.

Seventeen tons of almonds raised near Orland have been sold at about 10 cents per pound.

The Sonoma Tannery was recently destroyed by fire, involving a loss in plant and hides of $50,000

The recent sale of the H. P. Eakle stock of Shorthorns, at Woodland, is said to have been very satisfactory.

A good roads convention, held at Sacramento recently, was largely attended by delegates from Sacramento Valley.

The Petaluma Egg Exchange is in full operation and will work in harmony with the Sonoma County Poultry Exchange.

The Thermalito chestnut growers have produced a fine nut this year and anticipate good prices and big profits from their output.

Buck's Flat cattlemen, in Tehama county, are standing pat upon securing their prices and are refusing to sell to buyers at offers made up to this time.

Tehama county sheep owners have driven their sheep long distances for summer pasture, some going into the mountains as far as 120 miles. They are now returning from the mountain ranges.

The poundmaster of Sacramento recently impounded 1200 sheep which were being driven through the city and endeavored to collect a fee of $2 each. An appeal to the courts, however, succeeded in releasing them on a $40 fine.

Secretary Filcher is urging the uniting of the various agricultural societies of this state under one head, that is the State Horticultural Society, the State Agricultural Society, Veterinary, etc, should all be under the management of the State Agricultural Society.

Weather observers who have been connected with the measuring of the Sacramento and San Joaquin rivers are studying the water gauge system and the rainfall stations throughout Northern California and hope to improve the system of measurement of discharge of the river.

The Sonoma County Pomona Grange recently resolved that it is the duty of the members of that grange to support only those nominees at the coming state and national elections who will advocate and vote for the policies suggested by the state and national government.

Extensive preparations are being made for the Annual Institute to be held at the State Farm at Davis, next week. Several speakers from the University and some of the best farmers of the state will add to the interest of the occasion. The Institute begins next Thursday morning and will continue until Saturday afternoon.

Central California

The cannery at Sanger paid for cling peaches $22 to $23 per ton.

Prices on Tokay grapes are ranging from $1.10 to $2.15 per crate.

Old crop raisins are gradually being cleaned up, leaving a good condition for the new crop.

Work horses at Marysville have been troubled with the contagious disease, "pinkeye."

Sanger shipped about 200 cars of fruit for which canners paid the farmers about $45,000.

A company has been organized at Porterville for buying land and planting eucalyptus trees.

Florin Tokay growers are quite chesty over having secured the highest price for Tokays this season.

This state will produce about 300 cars of almonds this year. They will command about $3000 a car.

California will ship about 1800 carloads of lima beans which will probably average about $1600 a car.

A packing house at Lodi was burned recently and a large quantity of grapes and packing boxes went up in smoke.

The Woodbridge, San Joaquin county, winery is crushing about 160 tons of grapes per day. They will handle about 5000 tons.

Apple growers near Watsonville are pleased at the prospect of having the biggest apple crop ever shipped out of that valley.

The Santa Clara County Poultry and Pet Stock Association will hold its annual bench and bird show at San Jose November 9-14.

The thunder shower which recently visited almost the entire San Joaquin valley did considerable damage to raisins on trays and to table grapes.

The output of apricots this year will be not far from 1000 cars and about the same of dried peaches These will command from about $2500 to $3000 a car.

A farmer at Lodi is making a special study of the scientific side of fruit raising and maintains the added quality of the fruit is sufficient to justify most intelligent care of the fruit crop.

A barbecue was held at Jolon, Monterey county, recently, in celebration of the successful work done by forest rangers and their helpers in controlling a fire which was raging in the National Forest.

A Turlock grape juice company has been incorporated and $75,000 of its capital has already been subscribed. Several lots have been purchased for constructing the buildings, work on which will be begun in a short time.

The Armsby Company claim that the returns for California farm products which have been sent out of the state by that firm aggregate $41,000,000. These products include salmon, canned fruits, nuts, beans, dried fruit, raisins. It does not include any citrus fruits.

Hollister will have somewhat below the average output of hay this year, but considering the season it will be an exceptionally good yield. The total for the valley will be about 27,000 tons while in a good year 30,000 tons is normal. Growers are receiving about $13 per ton.

Southern California

A small tornado did several thousand dollars worth of damage at Indio last week.

Corn in the neighborhood of Brawley is promised to run about 40 to 50 bushels per acre.

Riverside Trust Company of Riverside will plant 100,00 eucalyptus trees within the coming season.

The Orange County Carnival of Products will be held in Santa Ana next week, October 15-16-17.

Public schools at Capistrano were closed for several days to allow children opportunity to gather walnuts.

Imperial valley has a great quantity of alfalfa hay stored and heavy shipments to Los Angeles are anticipated.

Brawley people have subscribed $10,000 as an inducement to a company to establish a condensed milk factory.

The Lake Hemet Water Company is to sink fifteen new wells to add to the water supply of Hemet and San Jacinto.

Claremont Pomological Club held its first meeting after the summer vacation at Ganesha Park at Pomona last Monday.

Westminster district in Orange county is contemplating a drainage project which will add valuable land to its tillable area.

It is now thought the output of walnuts of Southern California this season will not exceed that of last year by more than 10 per cent.

Highland reports about the heaviest rain for September of any section, aggregating almost 3 inches, which is the heaviest in its history for that month.

A packing house containing 7000 gallons of olive oil, 300 cases of extracted honey, a quantity of raisins and other fruit was burned at Escondido recently.

At the recent annual meeting of the Whittier Citrus Association the report of the secretary showed the shipment during the past year of 516 cars of citrus fruit.

The Waters cannery at Pomona Los Angeles county, has had a very successful season, employing during the entire summer 300 to 400 hands. It is a valuable asset to Pomona.

"California Dixie" is the latest title to be given to the Imperial Valley, which it claims because of its possibilities in cotton culture which is receiving a great impetus this year

Robert Smith of Riverside predicts that the coming orange crop of California will be 1200 cars short of last season while James Mills of the same city predicts about the same output as last year.

People of Lancaster and of the whole Antelope valley are planning for a great rabbit drive on October 17th. An excursion train will be run from Los Angeles and an effort made to cover as big a scope of country as possible.

Ventura county bean growers will save much from their crop of beans which were wet in the recent rain. They observed greater care in threshing than last year when many beans were threshed too soon after the rains and molded in the sacks.

The Coast

Portland, Oregon, butter quotations are now 32½ cents, second grade running two cents less.

Gresham, Oregon, has built a pavilion and is holding a live stock exhibit and grange fair.

Beekeepers at Walla Walla, Washington, will have a honey output of over 50 tons this season.

The sixth annual Agricultural and Industrial Fair was held at Nelson, British Columbia, last week.

Threshing has all been finished at Pullman, Washington, and the season has been the shortest in its history.

One farmer at Conconully, Washington, had his entire crop of wheat burned just after threshing recently.

Yakima valley will have an output of 1800 carloads of apples. The average price expected is about $2 per box.

A Colville, Washington, farmer lost over 80 tons of hay because of small boys smoking cigarettes near the stack.

The Spokane fair, which is being held this week, is to have an auction of hogs and sheep, which is a new feature.

The Oregon State Fair had 1335 head of live stock entered for premiums. The poultry exhibit numbered about 1000.

Harvesting and threshing has been finished at Athena, Oregon, and practically all of the wheat has been sold and shipped.

One New York firm has bought 80,000 boxes of Hood River apples, the purchase price being in the neighborhood of $90,000.

Prune pickers and packers are in demand in the prune sections of Washington and some loss will be caused by shortage of help.

Western Washington will produce about 3500 bales of hops this season. The entire state will produce about 10,000 to 11,000 bales.

The prune gathering season near Salem, Oregon, is more than ten days later this year than last. The prunes will run exceptionally large.

A La Crosse, Washington, farmer has prepared an exhibit of over 50 varieties of wheat which he has grown for exhibition at the state fair.

Spangle, Washington, has a new hybrid wheat which yielded this year 46 bushels per acre alongside other varieties which ran much less than that amount.

Wenatchee wheat growers who had formed a pool recently sold 175,000 bushels of wheat at 93 cents, which is the highest price received by growers there for years.

The milking contest which was conducted at the Salem, Oregon, fair between several of the best milch cows of the Northwest was won by the Holstein, though by an exceedingly close margin.

In accordance with a decision just announced by Assistant Forester A. F. Potter, 35.000 sheep and 19,000 head of cattle will be allowed on the Verde reservation, Arizona, during the coming winter.

According to a bulletin issued by the Department of Agriculture, Portland holds second place in the United States as a grain shipping point, New York only exceeding her, and that by a very small margin.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Starbuck & Son's Heavy Laying Barred Plymouth Rocks

We now unhesitatingly make the proud boast of the best laying strain on the coast, if not in the world. We will publish prices later.

Do you want to hear about our beautiful prize-winning Buff Orpingtons and Silver Wyandottes. We have something to crow about.

Wm. Starbuck & Son, Fullerton, Cal.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

INEXPENSIVE POULTRY HOUSES.

MANY people who would like to keep a few hens to supply home needs are deterred by the expense incurred in putting up poultry buildings. It is easy to put up a poultry house for 50 hens that will cost $200, and it is equally easy to house the same number, with all due regard to the health and comfort of the birds for less than one-fourth the sum indicated above. Again many renters both in country and village would like a poultry house that can be easily moved when the location is changed. Such a house suitable for California conditions can be built at small expense.

It is a good rule to adopt in starting in poultry to put less money into quarters and more into good stock. In this connection I wish to make a few suggestions regarding inexpensive colony houses that may be helpful to those contemplating starting in poultry. One mistake in constructing colony houses is the use of too much lumber. It adds to the cost and makes the building heavy to move. A small colony house that two people can handily move is a very convenient form of house to have. It may be of various sizes providing it is not too large, 4 x 5 feet, 4 x 6, 6 x 6—and even 6 x 8.

A PRIZE WINNER.

As to form it may have either shed or gable roof, the walls may be various heights to suit the individual taste or conditions. For frame buy good 2x4 pine scantling; have the mill rip these into 2 x 2 stuff. These do for corner posts when cut to desired length. Have pine boards ripped into strips two inches wide. These answer for other portions of the frame such as rafters skirting about the base etc.; the wall can be covered with burlap obtained from second-hand grain sacks and the roof with roofing paper. Stretch two inch mesh poultry wire over which the roofing is laid. If one prefers roofing paper on the walls it can be used at somewhat greater cost. A house 6 x6 feet will comfortably house 12 or 15 hens and can be built at small cost for material. If one prefers, the house may be put on runners made of 2 x 4 and moved with a horse. This would be advisable providing the size was increased from 4 x 5 feet, 5 x8 or 7 x 12. The window should be covered on the inside with wire netting to keep cats out. The window frame may be covered with muslin to advantage instead of filled with glass. This window which is hinged at the top can be kept open during the milder portions of the year, even at night, thus furnishing abundant ventilation. A small door in the end may have the frame covered with muslin also. The roosts should be made of 1 x 3 inch strips, movable and placed about 12 inches from the floor. The floor, if one is needed, should be made removable. Such a house makes a very comfortable home for two broods of chickens and the mothers until maturity. The mother teaches the chicks to roost when old enough and later on the cockerels and mother hens may be removed and this house may become the permanent home of the pullets.

SOURCES OF REVENUE FROM THE POULTRY YARD.

If one is to be successful with poultry at the present time every thing must be turned to account. If the owner has a garden or fruit trees the manure can be made to increase the income but its influence in this respect will depend in a marked degree on the care that is taken of the droppings to prevent loss of the plant food. While poultry manure is rich in fertilizing constituents, if exposed to the weather without preservatives it soon loses a large per cent. of its value. The sprinkling of the droppings boards with superphosphate of lime sold by the fertilizer firms preserves the plant food, adds to the fertilizing value and checks odors. If one cannot use the poultry manure himself orchardists and gardeners are only too glad to buy it especially where well cared for. As manure it is worth from 6 to 8 dollars per ton. Well preserved hen manure from 100 hens is worth some $25.00 per year. It is good business policy to look well after this valuable by-product of the poultry yard.—S. S. T.

YEAR OLD HENS VERSUS PULLETS.

Young hens make profitable winter layers if they molt early and quickly. If a hen molts and comes to laying in 60 or 70 days she will be as profitable as a pullet even though she lay but 75 per cent. as many eggs as the pullet. It takes five months to grow a pullet so there is three months feed and time saved. If the year old hens are slow to molt or poor layers then they should be sent to market, but a hen that has produced a goodly number of eggs during the breeding season will in all probability do well after the molt providing she molts early.—S. S. T.

POULTRY BREVITIES.

A dozen eggs at Thanksgiving are worth two dozen in April. Eggs are always high in fall and early winter.

* * *

Eggs are the foundation of the poultry business. Very few of the birds bred to win in the shows are also bred to lay.

* * *

It is a waste of time to treat a fowl badly affected with roup. If it recovers it will never be anything but an expense.

* * *

Where poultry yards run parallel to one another it is wise to have a board partition two feet high at the bottom of the division fence. This serves the

double purpose of a wind break and a means of keeping cock birds from fighting.

* * *

The profits from poultry keeping at the present prices of feed where this feed must be bought, are very small, much work for little money.

* * *

Turkey breeding on a small range seldom proves profitable. Their proper place is on a grain ranch where they pick up a large proportion of their food.

* * *

Birds in confinement need a moderate amount of exercise although they need not be kept on the jump from morning till night as is advised by some writers.

* * *

It costs no more to keep a good hen than a poor one, and it is as easy to make $100 from 80 pure bred hens as to make the same amount from 100 mongrels. If you are going to keep hens, keep good ones.

* * *

Line breeding simply resolves itself into getting as near an ideal bird as you can and breeding progeny very close to it, that is breeding in and in as long as the results are good and the stock vigorous.

* * *

Those who have been in the business of raising poultry the longest and have given it the closest study are a unit against the erection of elaborate buildings. Simplicity and comfort are the chief considerations.

* * *

Yellow Legs.

Can you tell me what causes the legs of my white Wyandotte hens to turn white after they are a year or more old? These same hens as pullets had deep yellow legs.—E. M. H.

It is a very common thing for the legs of adult white Wyandottes to bleach as they get older, in fact this is true of any of the yellow legged varieties.

The best means that I know of keeping the legs yellow is to provide alfalfa range if possible and to feed corn liberally—plenty of bright straw in the scratching sheds is helpful.—S. S. T.

* * *

Systems of Changing Layers.

Can you give me any method or system by which laying hens can be distinguished from non layers? We have a flock of 100 and a large per cent of them are non layers as the egg returns during the past year have not been satisfactory. Are the methods advertised for sale reliable?—Mrs. E. H.

An experienced poultryman can distinguish more or less accurately the hens in the flock that are laying or about to lay. The condition of the comb and the actions of the hen are relied on to give this information. There are so called systems in which the point relied on to give information as to the laying qualities of the hen is the width between the pelvic bones. This is an ancient test and not very reliable.

If one goes about early in the morning before the hens are off the roost he can tell whether the hen will lay that day or not by passing the finger into the egg duct. If this hen is put in a separate yard with others of similiar character and examined again the next morning it will be easy to determine how many eggs such a hen is laying in three succeeding days. In my experience this is the most practical method of getting at the laying qualities of a hen. Of course the most reliable method is the trap nest.

Gridley, Butte county, farmers are entering more and more into the dairy industry.

A DUST BATH.

By a dust bath the fowls scour off the scurf and scales from the skin and rid themselves of vermin. The finer, lighter, dryer the dust the better, because the dust must be light and fine to get into the breathing pores of the lice to kill them. Sandy loam is often better than sand or some kinds of road dust which are cold and heavy. Wood ashes and coal ashes lighten it up. The best place for the dust bath is in the open air of the scratching shed. Here the dust quickly settles and the hens that are not dusting are not compelled to breathe it. Fowls are apt to stand upon the edge of a dust box and befoul it. The interior arrangement of a poultry house should not occupy the floor space. The hens need it all. The floors are more easily cleaned.—Poultry Houses and Fixtures.

ORIGIN OF THE HEN.

"Which did the Lord make fust, Brudder Johnson, de hen or de egg?"

"De hen ob cose—de egg comes from de hen."

"Yais, but de hen comes from de egg, too."

"Now, see yar, Brudder Johnson, if de Lord made de egg fust, he'd had to make an incubator to hatch it, a sawmill to get de wood fo' de incubator, a tin mine for de tin, a winder glass factory fo' de glass, a cotton mill fo' de cotton battin,' a drug store fo' de thermometer to tell de temperature, besides gettin' de permission o' some walkin' delegate to operate dem industries an' takin' chances on de eggs hatchin' at dat. No, no Brudder Johnson de Lord dun simply make a hen fust and ah reckon he didn't make a colored man fo' a year or two after."—Puck.

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will prepay freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

$50 Cash Prizes

$20 first, $10 second, $5 third, fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you, and no peddling or canvassing. And to each one competing we will also give a useful article. Send postal for particulars, mentioning this paper.

Browning of Ogden, Utah. Stock for sale. Write for prices.

MISSION VIEW POULTRY RANCH, MRS. C. D. HUBBARD, SAN FERNANDO, CAL.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Germain Seed Co., Los Angeles
Distributing Agents for So. Cal.

KEEPING THE YARDS CLEAN.

To keep the poultry yard clean and in wholesome condition is the first step toward maintaining the health of the flock and attaining success. Even where fowls have the run of a farm, the immediate surroundings of the poultry house become polluted in the course of time; and where the runs are limited it takes but a few months for the top soil to become so foul that it is a constant menace to the health of the flock.

In a damp location it requires constant effort to keep the soil in proper condition and great care should be taken to prevent water from standing in the yards at any time as this will leach the droppings into the soil and cause it to elaborate gases which will be dangerous to the health of the fowls.

Where land is plenty, the yards should be so arranged that they can be changed from one place to another every year, or plowed and planted to some rank growing crop which will absorb the poisonous products of the droppings and change them into green food of considerable value.

The late T. E. Orr followed a method which has always seemed good to me. He had his yards divided into two parts. In the spring one half was sown to rape, while the fowls ran in the other half. Within six weeks after the rape was sown a heavy crop of leaves covered the ground. The hens were then turned into this and the other half was sown to rape. This treatment was continued during the season and the hens had a plentiful supply of green feed of the best kind, while the soil in the yards was kept always clean and sweet smelling.

Another good plan is the one followed by Wallace P. Willet, Orange, New Jersey. He kept more fowls on a given plot of land than any other poultryman we ever knew. His method was intensified poultry-keeping carried to the limit. We have seen more than four hundred fowls on less than one-third of an acre of ground at his place and every one of them seemed to be doing well.

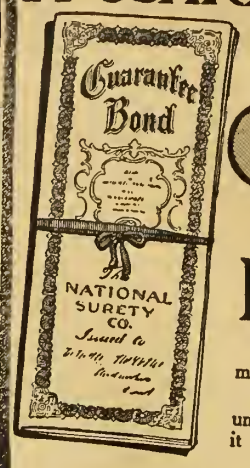
His plan was to dig out the top soil to the depth of a foot each year, using this as a fertilizer. In the place of the soil so carted away, clean sand was hauled in to remain for a year. By this system Mr. Willet made some very rich land and kept his poultry yards in perfect condition.

A good many who have started in with a show of making a success of poultry-keeping have, after three or four years, found disease their worst enemy, simply because they have forgotten that cleanliness about a poultry-yard does not consist altogether in keeping the house clean and feeding clean feed. If the soil becomes filled with leachings of the droppings and the dampness causes the droppings to decay thus liberating foul odors, as much damage may be done as would arise from the direct introduction of disease germs through the blood.

Where fruit trees are growing in the poultry yard they will keep the soil in good condition for a long time, especially if the ground is kept cultivated. The roots of the trees take up the phosphates and ammonia in the droppings and convert them into wood, leaves, and fruit, at the same time purifying the land.

This matter of clean soil is so important that beginners should not neglect it. If they get the habit of watching the condition of the soil in their poultry yards, they will soon learn to detect any appearance of foulness and take measures to restore it to a properly healthful condition. Fowls are peculiarly liable to become affected with the ammoniacal fumes which arise from the droppings and they should not be compelled to breathe them at any time. If a poultry yard is covered with a coat of droppings, no matter how fine they may be or how innocent they may appear, a little rain and a few hours of hot sunshine will fill the air with fumes that soon plant the seed of disease in the flock. At this time in the year this matter should not be neglected a single day. Do not be content with simply cleaning the poultry house. Clean the yards also.—Poultry.

A GUARANTEE BOND with EVERY ROLL of CONGO "NEVER-LEAK" ROOFING



The Surety Bond Guarantee back of Congo makes it the most attractive roofing proposition on the market.

We have claimed right along that 3-ply Congo was an unexcelled Ready Roofing at the price, and we now back it by the National Surety Company's Guarantee Bond.

This Bond covers a period of 10 years.

It is broad, liberal protection to the purchaser. It means we have faith in Congo. It protects you absolutely!

A good many roofings carry guarantees of different characters, but not a single one of them gives the purchaser a *Surety Bond*. That's the only kind of guarantee worth having!

We know Congo is the surest protection against weather, climatic changes, heat and cold, for it is absolutely not affected by any of these. It never dries out, cracks or melts, and so perfect a roof protection does it make that it is aptly called the "Never-Leak" Roof. If we were not *sure* of these facts we wouldn't dare give a Surety Bond with every roll.

Send for a sample and further information to-day.

SPECIAL NOTICE—If any Congo rolls that you purchase do **not** contain Guarantee Bonds, write us at once, telling us where and from whom they were purchased, and we will at once mail you the missing bonds.

GRIT, SHELL AND CHARCOAL FOR HENS.

These materials are all essential to the good health of market or laying stock but do not mix them together. The handiest and best way of placing these things before the hens is to have a small box three or four inches deep, about a foot and a half long by six inches wide. In this have three partitions, one place for grit, one for shell, one for charcoal and one for granulated bone. Have the box made so as to hang it on the wall by spikes a few inches above the floor, then no litter or dirt will get into it.

A poor practice is to feed this material in with the other food. The fowls know better than ourselves how much they want of this stuff, and it is better to let them pick it out as wanted than to compel them to eat more than is good for them, which they are very apt to do if mixed with the mash. It is all right to mix sand or fine grit in the food for small ducks but with other poultry it is better not to feed it in this way. When placed before them I have never known fowls to over eat of either grit, shell, charcoal or bone, although they will sometimes partake freely of it at first if it has been denied them for a time.

White Wyandotte Cockerels For Sale
A few choice ones from best strains. Cheap—must be disposed of this month to make room in my yards.
Wm. C. Parker, 111 Pacific Ave., Santa Cruz, Cal.

A good many people who keep poultry and lots of it, look at these supplies as unnecessary and uncalled for by the poultry, but it has been proved time and again that the hens do better when provided regularly with these materials.—Successful Poultry.

NAKED POULTRY.

Any naked hens or chicks conspicuous on your farm? They began to molt during hot weather but after shedding did not put on their clothes again. That won't do because winter is coming, and the nights are already too cool for bathing suits.

The thing to do is to make them grow feathers. Feathers are made of protein and you must give the naked fowls abundance of protein foods so they can clothe themselves again. Put the naked ones by themselves in a comfortable place and see that they get plenty of skim-milk, oil meal, or similar feeds rich in protein. Give liberally of corn, too, for they need heat to keep them warm and the carbohydrates in the corn will supply it.

Next summer see that the fowls have proper feed early so that they will complete the molt before cold nights come.—Successful Poultry.

One cubic foot of water equals 62½ pounds.

Bees and Their Care

BEES FOR FARMERS.

To get the very best results from bee keeping, one should provide liberally for the bees; that is, the bees should have plenty of room when needed, and have plenty of stores to feed upon, if not provided with stores to be fed, because no colony of bees will breed up rapidly and have plenty of bees when the honey season opens unless they have plenty of stores to raise young bees upon. If they have to wait until they can gather new honey before breeding up to have large numbers of bees, the first honey season is half or more gone before the bees are ready to do much.

Too Small.

Perhaps 75 per cent. or more people who buy hives get the eight-frame hive and only a story and a half hive at that. This is too small a hive for the bees to do their best, and in such a hive in a good season bees will take it out in swarming mostly, whereas if they had been in a large hive they would not swarm so much, but store more surplus honey. The eight-frame hive may be large enough for the bees to commence at the beginning of the season, but just as soon as they get well to work, they should be supplied with another super so as to make plenty of room. This would be what is called a full two-story hive; the supers are only half bodies, that is, just one half as deep as is the regular brood chamber. For our own use we use the ten-frame hive and a two-story hive at that; in fact, when the honey flow gets well on, we put on a third story and have used the fourth story and had the colony to fill them all.

Well Ripened.

Honey should be well ripened before taking it off. Honey when first gathered is thin and watery, but if left in the hive until the bees evaporate the honey down until it is thick, it is then well ripened and as good as it will ever be. We extract our honey from the combs and by replacing the combs we get them filled several times in a season and thus are able to secure a larger crop of honey.

Bees should never be placed into an empty hive, but if one does not have combs already built out, the frames should be filled with foundation; this not only gives the bees a good start, but gets all the combs straight and also keeps the bees from building drone comb. If many drones are in a hive, one need not expect much, if any, honey from that hive, as the drones will eat it all up. We know that few will buy foundation, thinking that the bees can provide for themselves, but these parties do not seem to know that it would be the very best thing for them to have provided for the bees and so they get but little from the bees, and often they find that bee-keeping does not pay them.

Enough Room.

We have secured 200 pounds per colony in three different seasons and last season, which was rather a poor season, in many places, our bees paid us a little more than $10 per colony and we increased one-third, so we not only had what we started with, but the increase besides. However, by our management, we secured about four times as much as any one else around here. In talking with some, they seem to think it is in the location, but we are sure that many others having bees have as good and we sometimes think a better location than we have. We hardly think it necessary to warn any one not to provide too much room at first, but give the bees added room as it may be needed; if too much room was in the hive when not needed, it takes too much of the energy of the bees to keep the hive warm enough for the bees to raise young bees well, although we had rather err on the side of too much room than not enough.

Forehanded.

One should have supplies ready when needed, as it is poor policy not to be ready when the bees are. We have known of some that have neglected to procure needed supplies until they needed them badly and not being able to get them as soon as needed, suffered quite a loss in honey on that account.

We doubt if anything one has on a farm will pay as well for the investment as do bees, as they are not only needed to well fertilize fruit bloom, but pay immensely in honey also; it may be from 200 to 500 per cent. on the investment and then have all the first investment one started with and any increase obtained besides. We know that on account of the very high price of lumber supplies are higher in price than they used to be, but for this very reason any one keeping bees should have the best results from keeping bees, and so make out of it a good return for any investment one may have in keeping them. We have hives we have had over 20 years, also combs that long, so if one will take care of the fixtures after the first cost they last nearly indefinitely, and so do not cost much after all, considering the time that they will last.

It is a most fascinating study to observe the habits of bees and for one to make them do their best, and it is said that a lover of bees is most generally a good citizen.—St. Jo Fruit Grower.

The three principal conditions that induce swarming are a crowded hive, lack of ventilation and a good flow of honey.

By giving plenty of bottom ventilation and storage room, swarming can be very largely controlled, though there are times when the bees will come out in spite of all we can do.

Each hive must have a shade board over it.

Many swarms may be saved by seeing that the wings of every queen in the apiary are clipped.

Nothing is better for this purpose than a pair of curved manicure scissors, and all danger of clipping off a leg is avoided.

You need not even touch the queen with your hands; simply lift out the comb on which she is, give a quick clip on her gauzy wings, and the trick is done.

Then when the swarm comes out later on, she will be found hopping about on the grass; and when the swarm returns to the hive, which it will always do, never absconding without the queen, she can be dropped into the hive, all queen cells cut out, ventilation and added storage room given, and in most cases swarming for that colony will be over.

If not at work in the apiary each day, it will be well for the beekeeper to examine the trees and nearby bushes each afternoon, as often swarms that have come out in his absence will be found hanging, and can be hived and thus saved.

The Angle of a Hoe

Grasp a Keen Kutter Hoe as you would in the field—better yet, put one to actual service, and see how well it fits its job. The angle of the blade is *just right.* If you strike at a weed, you are sure to cut it—if you "hill" a plant, it carries a full load of earth each stroke and does it all in the *easiest position* you can assume.

KEEN KUTTER

hand tools for the farm—Forks, Hoes, Rakes, Scythes, etc., are fitted by *model* and *temper* for great service and long wear.

Keen Kutter bench tools are the best to be had. The list includes Planes, Saws, Axes, Hatchets, Hammers, Adzes, Augers, Drawknives, Chisels, Gouges, Bits, Braces, Gimlets, Squares, Bevels, Files, etc., besides every possible tool and cutlery for the household. Look for the trade-mark—it guarantees *quality.* If not with your dealer, write us.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Alfalfa and Eucalyptus.

Will alfalfa do well with a row of eucalyptus planted along the north side where I have plenty of water for both? Would Eucalyptus tereticornis make a wind break? What shape does it grow in?—Subscriber, San Luis Obispo.

With plenty of water which you say you have applied to the alfalfa there is no reason why you should waste but very little land in growing trees along the border of your place. We should surely recommend the blue gum or E. globulus rather than the E. tereticornis. Blue gum is more rapid in growth and has been tested both as a windbreak and as a producer of good hardwood. The tereticornis has, however, an excellent red colored timber, very hard and good, used in Australia for building purposes, ship building, wheel wright work, posts, fencing, etc. The tereticornis attains a height of about 100 feet with a trunk often 6 feet in diameter. The tree has a more branching habit and is not so tall growing as the blue gum.

A Roup Experience.

Perhaps my experience with "roup" may be of some benefit to E. H. P. or other readers of your paper. My flock seemed to be afflicted with very bad cold, which developed into swelling of the eyes and head.

A friend told me a film of coal oil on top of the drinking water would prevent further spread of the disease and every day for five days after beginning the use of oil I found worms in the drinking trough.

The water needs to be three or four inches deep so they can dip their nostrils well down. The symptoms of "cold" disappeared immediately and several with badly swollen heads are almost well now.—S. L.

Preserved Figs.

Please give recipe for preserving figs such as those found on the market in glass jars.—A. G. A., San Rafael.

See recipe column on Household page of this week's Cultivator. We cannot say that either of the recipes given are the same as used in the trade, for such goods as sold by the grocers, but we are assured these are excellent recipes.

Packing Prunes.

Will you kindly inform me through the Cultivator as to cost of packing prunes in boxes?—E. W., Geyserville.

We believe the cost is generally considered to be about 12½ cents per packed 25 pound box. But as a rule it is considered that the increase in weight which comes from the dip practically balances the cost of box and packing. We assume you mean this not to include the cost of drying, which will not exceed $15 per dried ton.

Sowing Bermuda Grass.

A subscriber at Merced refers to our recent answer to a query as to sowing Bermuda grass, as follows:

I beg your pardon, but in the Cultivator of Aug. 27, you made a little mistake in regard to the propagation of Bermuda grass. It is the root that is cut up, (there must be one or more joints to it) then harrowed in. In the South, on the black, waxy land we were not afraid of it, but on this sandy soil, when a horse can carry it on his feet all over the place, we should not want it.

We are glad to receive the correction above but we still understand that in some sections of the South the method of running the grass through the cutter and using the clippings is successfully practised.

Alfalfa on Alkali.

What is best time to re-seed alfalfa on alkali ground? The field is badly infested with love-vine. Can I get rid of it? There are some spots of black alkali in the field where I started young vines,and I am told that gypsum is beneficial.—Subscriber, Selma.

The best time to seed alfalfa on alkali ground we are told by an old alfalfa raiser is not to seed it at all. There are other crops which will stand alkali much better, especially sugar beets. However, if necessary, thorough preparation and seeding this fall will give a start if heavy rains are given during the winter season. If the alkali is black, treatment with gypsum will be very advantageous. Dodder, or love-vine, is best removed by piling straw over the infested spot and burning it. You may destroy part of the alfalfa but it is a bad pest and requires vigorous treatment. The gypsum surely will aid the young vines.

Fruit for Poultry.

I note a query under this head in the Cultivator of Sept. 24:—"Will it injure chickens to be fed tomatoes, watermelons, etc.?" answered in the negative. Now, my experience with that of friends and neighbors is that while the flock greatly enjoy those things and may keep healthy on them, such feed is fatal to egg production. Many will develop a looseness of the bowels and you may see no more eggs till spring. It seems the seeds of melons and pumpkins have a specific effect on the kidneys in cattle and what corresponds to those in hens, away from production of milk or eggs. And fruit acids probably prevent formation of egg shell.—B.A.R.S., Arroyo Grande.

The Other Side.

On page 304 of the Sept. 24th number, I see an article from the Imperial Standard giving the cause of the great loss sustained by the melon growers and the remedy for the future. I learned this lesson from my brother-in-law, a Presbyterian preacher who gave me advice on a subject that he knew nothing about but thought he did. I lost out. Since, I never take advice from any but practical experienced persons and I judge from the article that the Standard people are neither. I can not see why another expense should be put on an already losing industry and where would you find better judges of what was suitable to ship than we had at Holtville? There were three inspectors of years of experience who faithfully examined

Peckham Says:

What are you going to do with the boys? Keep them to work for a small salary all their lives? Why don't you

Send Them to Corcoran

Where each of them can become independently rich in a few years?

The Corcoran district is big—the opportunities are equally big. It is growing faster than any other section in California.

Thousands of acres, the richest in the State, are waiting for hustling young fellows—and it's easy to make there—all that is necessary is a willingness to work and intelligence to grasp the many opportunities that are waiting on every hand.

Come with us and let us show you the coming farming section of the State—where you can make $2000 a year—and bring the boys—let them see for themselves. It won't cost much to do it, or send for a copy of Profitable Realty, our magazine, which tells the story.

George C. Peckham & Company

203-4-5 Union Trust Bldg., Corner Fourth and Spring Sts., Los Angeles Cal. Phones: Main 3221, F5392.

Sonoma County Pomona Grange had a successful meeting at Glen Ellen recently.

every load and allowed none but perfect melons to go—perfect in shape, netting and neither too green or ripe or they were promptly condemned.

We have worked hard here for tarce years to make a reputation for the Cocopah brand; we made money two years but this year have lost it all and the crop was handled by the same people (Lyons Bros. & Co.) What puzzles me is why the first on the market brought nothing.

What we need is co-operation not only in raising but in selling, we need a market with fixed prices at the R. R. station and then not raise more than is needed at a reasonable price.

Just see what the valley has lost this season, there were about 2,000 cars shipped containing about 700,000 crates; these cost to pick and pack 30c each and the crate 20c each making 50c cash that we lost on every crate shipped; besides we stopped picking and left as many more in the fields because they were not bringing the cost of shipping, say nothing about the cost to raise, rent of land, cost of water, seed, etc., etc., so we gave six months labor and $350,000 to those who are fully organized. The ice man got his money, the R. R. got its and the commission man his. We should have received $1.00 per crate for all we raised which added to what we are out would amount to one and one half million dollars but as it is we have the empty bag to hold (money bag) so I say first, last and all the time to co-operate.—W. W. Shepherd, Holtville.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Trouble with Kidneys.

Have an 8 year old mare. She got her hind leg caught in her halter rope about 3 days ago, and somehow she worked the rope up on her thigh, and it chafed her quite badly. Twelve hours after she got caught, she commenced to sweat and kept it up for about 10 or 12 hours. Ever since that time she has been passing water in small quantities and as often as four times in one hour. The water seems to be all right, but she sweats easier than she used to. I am working her in sandy loam soil with another horse, plowing. She eats her barley hay all right and drinks regularly. She has no fever. Her pulse is normal, like other mare. She has regular movements of the bowels.—W. E. G., Anaheim.

I think the mare has inflammation of the kidneys and bladder.

Give her one ounce of turpentine in six ounces of raw linseed or cottonseed oil. Three times daily.

Are you sure she has no fever? No one can tell unless a thermometer is used. You can't tell by feeling her pulse.

Do not work a horse that is in her condition.—R. T. W.

Crumbling Hoofs.

I have a 4 year old horse, whose right front foot for ⅜ inch on the inside next to the outside wall crumbles away like bread crumbs so much so that there is a cavity about 1⅛ inches deep. There is also a hole in one side of the frog about as large as a half dollar. He is quite lame. He stands in stall with ground floor during day and is in pasture at night. I have not worked him.—M.H.G.

I shall have to know more than this. Is there a cavity inside the walls as if it was separated from the foot? When you cut away the dry, crumbly horn is it dry all the way or does it run into a foul smelling warty growth?

There will be no harm in your cutting away the outside wall as far as there appears to be any diseased condition.

Abscess.

We have a mare that is in the habit of pulling on the halter that has the appearance of poll-evil. Is very tender back of ears; also the cords on side of her neck seem very sore and rigid. She cannot turn her head without turning her whole body. When she stands still, hangs down her head and lops ears. Has been this way about two months. We have blistered her a little on top of head and back of ears, but not severely. There is no opening or discharge of matter. Can you tell us what to do?—M.H.G., Lemoore.

There is an abscess forming on the top of your mare's neck, I think, and in time will be a case of "poll-evil." You should turn her into a lot or box stall, do not tie her with a halter. If you drive her at all use a halter instead of a bridle, fasten the bit to it and slip crown piece well back off the sore. Use a poultice instead of a blister.

As to treatment, it is useless for me to lay out any course, it is a difficult thing for the best of veterinarians to treat, let alone a rancher. Get the best veterinarian you can find. Try Dr. Frank Griffith at Hanford.—R. T. W.

STATE CAPITOL REMOVED.

I fully agree with your editorial against the removal of the State Capitol from Sacramento and the State Grange, at its session in San Jose a year ago, condemned it as follows:

"Whereas: the California State legislature at its last session introduced and passed a bill known as the 'Capitol Removal Bill' submitting to the vote of the people the question of changing the seat of government of our State, and

Whereas: believing that the change proposed will impose a heavy and wholly unnecessary burden of taxation upon the farmers of the State, therefore, be it

Resolved, that the California State Grange, in annual session assembled, is materially opposed to changing the capitol of the State."—John Tuohy, Tulare.

FARM LANDS FOR SALE.

DAIRY AND RANCH—ONE-HALF INTERest in thirty acres within one mile of courthouse, set to alfalfa; well flows fifty inches; necessary buildings; twelve cows; milk wagon; route paying $200 per month. $2000 buys my equity. Am compelled to sell on account sickness. This is one of the best buys around San Bernardino, and any one looking for a home as well as an investment should not miss looking up this place. Address GEO. S. BURROWS, CARDIFF AVE., San Bernardino, Calif.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land sulted to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—165 ACRES IN VENTURA CO., 4 miles from Moorpark; 90 acres under cultivation, suitable for beans, corn or hay; balance pasture land, all fenced; ½ mile from school; 10 acres in fruit, full-bearing peaches, apricots, pears, apples, prunes, grapes; price $3000. Inquire or write to owner, W. C. MAYHEW, Moorpark, Cal.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

ORANGE GROVES.

FOR SALE—ORANGE LAND, 60 ACRES, 2½ miles east of Strathmore Station, 6½ miles from Lindsay, same distance from Porterville. Nearly all "dry bog" soil and very little leveling; a splendid well, double cased to bottom; price $125 per acre; $3500 cash, balance to suit purchaser. A. C. AMERINE, Lindsay, Cal.

FOR SALE—AT COVINA, THE BEST OR-ange district in California; 5 acres, ½ Valencias and half navels, in full bearing; only $5000; I also have a number of other bargains that I think will interest you. JEROME REYNOLDS, Covina, Cal.

POULTRY

SPECIAL SALE—TO MAKE ROOM FOR my young growing pullets I offer at common stock price all my this year's breeding pens, including many prize winners. This is a rare opportunity to get first class breeders cheap. At the last L.A.C.P.A. show my birds won all specials, all first prizes, and all seconds but one, that were offered on Barred Rocks. CHAS. E. SMITH, Gardena, Cal. San Pedro car via Gardena to Smith's Crossing.

BUFF ORPINGTONS—WOULD YOU LIKE the very best at the price of common stock? Sullivan's COMMONWEALTH STRAIN you may have at HALF PRICE FOR THE BALANCE OF THE SEASON. Write us and learn the reason; get record and illustrated catalogue FREE.—MR. & MRS. W. S. SULLIVAN, Agnew, Santa Clara Co., Cal.

FOR SALE—BARRED ROCK PULLETS AND cockerels. M. F. COVELL, Escondido, Cal.

BEES.

FOR SALE—OR TRADE, ON THE BASIS OF $3200; 330 stands of bees in Imperial Valley, fully equipped and shaded power extractor; 3-roomed house, farm implements and 10 acres of land. A bargain. I have a fine location but poor health. Address H. PERKINS, Calexico, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Anfield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 F 9th St., Los Angeles, Cal.

WANTED—EXPERIENCED BUTTER MAKer and herdsman for dairy of 150 cows; must understand testing cows and running steam plant; board furnished. Address with references and wages desired, A. L. SAYRE, Madera, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

SHOPPING BY MAIL.

SAVE MONEY AND GET A BETTER choice by shopping in a large city. We will do your shopping for you. Send for our free book. It tells you how. LOS ANGELES PURCHASING CO., 506 Bradbury Bldg., Los Angeles, Cal.

HOGS.

REGISERED BERKSHIRE AND POLAND China hogs, both sexes. C. A. STOWE, Stockton, Calif.

PHEASANTS.

FOR SALE—FIFTY CHINESE RING NECK Pheasants in lots to suit the purchaser. Cocks $3.00 to $5.00, hens $1.00 to $2.00. Mrs. R. S. Spaulding, 533 WALNUT St., Woodland, Cal.

WANTED—GIRLS AND BOYS.

"I'm making up my list of boys
And girls," said Father Time,
"To rule and lead and help the world
In every land and clime
A quarter century from now,
I've room for hundreds yet,
And I go hunting everywhere
A larger list to get.

"I find that every boy I meet
Would like to see his name
Written in golden letters, high
Upon the roll of fame;
But, some are fond of cigarettes,
Some gamble on the sly,
Some drink, some keep bad company,
Some shirk, and others lie.

"The girls would all delight to see
Their names upon the roll.
But, some are fond of finery,
And some cannot control
Their tongue; while others, with a laugh,
Throw all their chance away
By idle folly, or are spoiled
By temper's angry sway.

"And so my list has many gaps,
And many names I need,
Since none except the strong the pure
The self-controlled should lead.
So I go searching everywhere;
The time is short, you see;
I need a thousand boys and girls,
Alas! Where can they be?"

—Priscilla Leqnard.

MR. GNAGG AT THE BREAKFAST TABLE.

IS this stuff supposed to be coffee? Tastes like shellac mixed with gum arabic and gutta percha. Has a suggestion of garlic, too. What d'ye pay a pound for it?

Forty cents? Oh, you do, eh? I thought so. It isn't the fault of the coffee. It's because the pot it's made in is only scrubbed out about once every eight years.

Oh, never mind showing me the pot. I won't look at it. That's your old scheme. Every time I say a word around this plant it's your system to try to crowd me into a corner and bully me out of my statement.

What d'ye call these things? Corn muffins? I thought they were baseballs. All they need is the seams and a little more roundness and they would be baseballs.

It's no wonder I feel like a sick caterpillar every morning when I get to the office, with this kind of truck in me. I'll be breaking down one of these days, and then I s'pose you'll be whimpering around because we can't keep up a ninety dollar flat and because you can't hike out and buy thirty-eight dollar hats that make you look like something at the funny end of the Mardi Gras, and all that.

That's the trouble with you women. You want it all. You fire a man off to his work with an impossible mess of vile, hurry-up food in him, and then you expect him to work like a lumberjack in a long drive to get the money so's he can run home and dump it in your lap. If I—

Look here, my dear, why don't you comb your hair before you come to the table? Oh, don't tell me that you have combed it. I s'pose you'll admit that I'm not blind, won't you? Why, it's flying around like the hair of a witch riding through the air on a broom.

But that's the way with you women. "What's the use of running after a street car after you've caught it?" is the maxim of all of you. You get your man by titivating and primping up and make a life business of preening and pluming and all that sort of thing, and a little while after you've got him and he has no chance on earth to accomplish any decent kind of a getaway, why, you promptly degenerate into slovens, and then your attitude is, "What are you going to do about it?"

Oh, don't tell me. I don't pretend to know much about a lot of things, but if I don't know women like a book, why, then I'd like to see the bug wagon back up to the door and take me away.

But you make a mistake, let me tell you, in showing up before your husband with your hair flying all over the place and with an old house jacket—What's that? A fresh kimono that you just put on this morning?

Oh, is that so? Well, if that's a fresh kimono all I've got to say is that you'd better change your washer woman. It looks as if it had been worn for three or four weeks by somebody down on Delancey street.

These eggs are as hard as bricks, and yet you know perfectly well that I can't eat eggs unless they're soft boiled. How's that? They were boiled only a minute and three-quarters by the watch hanging in the kitchen? There you go again! Always there with some kind of a wriggle. That's like a woman. They make a perfect business of trying to convince their men that they are stark, staring, raving crazy and ought to be in a lunatic asylum.

These eggs are not only the hard boiled kind like you get at a railroad eating house but they've got a taste that reminds me of the smell of a pond I used to fish for tadpoles in when I was a kid.

Very best eggs in the market, are they? Well, it's a hundred dollars to a bum cocoanut that I paid the best price in the market for 'em, but that doesn't dope it out that they're fit to eat, unless I'm a maniac, and I guess I'm not exactly that yet, although it's a cinch I will be if things around here don't begin to break a little bit better pretty soon.

How's that? The electric light bill has got to be paid today? D'ye mean to tell me that you havn't paid that electric light bill yet? Didn't I hand you the money to pay that bill six days ago? Oh, I didn't, hey?

Oh, well, I'm a paretic all right, then. I've got dementia flattiana, that's what's the matter with me. I just think I gave you the money to pay the electric light bill, while as a matter of fact I handed you a nickle to go get a bottle of arnica.

Great! First thing I know you'll have me imagining that I'm Peter the Great or John the Piper's Son, and then you'll be so tickled to death that you'll go around tra-la-laing like a little birdie perched on a brier bush.

How much is the electric light bill that I dreamed I paid? Six seventy-eight?

Whee! What is this place we're running around here, a parlor for electrical vibratory treatment or a Tenderloin ginmill? Six seventy-eight!

Look here; do you keep the electric lights—all the electric lights in the place—burning all day long? As soon as I get out of the house do you make the rounds and turn on the electric lights just for the sake of giving the bill a boost? Because if you don't there must be something mighty queer about—

How's that? Oh, I am to remember, am I, that I had four poker sessions in the dining room last month and

Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

that we played until four or five in the morning, with all of the dining room electric lights burning? Oho! So you throw my little occasional game of poker into my teeth, just like that, do you? Well, what d'ye think o' that!

A rap right on the point of the jaw at the breakfast table because I have a few friends once in a while to sit into a piffing little game of fifty cent poker! Well, if that doesn't beat me! Getting bawled out at the breakfast table because I—

How's that? You didn't say a word about my poor little miserable poker game? Oh, no, you didn't. You made the observation that the weather indications were that maybe it wouldn't snow in August. That's what you said. Then you said that these skyscrapers are sure to fall down some of these days if an earthquake drifts around and hits 'em an underground wallop.

Oh, never mind that wriggling stuff again. You know just as well as you know you are alive that you said, in so many words, that I was becoming a slave to the poker habit, and that it would ruin me if I didn't watch out, and that you'd noticed I was neglecting my business on account of it, and that I ought to know that there was a gambling streak in my family and to be afraid of it, and a whole lot more just like that. That's your old game to flare out and say just what you want to say and then to come right back and deny saying anything after you know that all of your barbs have struck.

Oh, well, what's the use? The man who expects a woman to have any sense of reason or logic is a pinhead who deserves all he gets and a blamed sight more. I won't play poker any more, seeing that you make such a shriek about it.

I won't play anything. I'll just work, work, work, all the time, and let you do all the playing. I could pick up a few more dollars by sticking around the office until midnight, and you could devote the extra money to more hats and matinee tickets and things, and I could—

Here's $10. Pay the electric light bill out of that. It's the last money I've got, except forty cents in change, and I can get my lunch out of that, besides riding downtown and back. After you pay the six seventy-eight electric light bill you might as well drop down to Twenty-third street and stake yourself to a hundred yards or so of that nickle val. lace that you'll find on the bargain counter somewhere or other.

Never mind me. Us male dubs were only brought into the world for the purpose of working the flesh off our bones for you women, and it's all right. I've got no kick coming. I'm only a part of the system, that's all, and no one man can change a system.

By the way, what's become of that gray suit that I had last year? I wish you'd dig it out today and send it to the cleaner's and have it—

Huh? You've SOLD it! SOLD IT! Wait a minute. Let me hang on to myself. I don't want to go nutty if I can help it.

How's that? I wore it when I went fishing last fall, and it was all worn out and unfit to be fixed up again? Madam, be so good as not to sit there and tell me things like that. Kindly don't do it. I can stand a heap, but there's a heap that I cannot and will not stand.

Just a minute. Do you mean to tell me that you have deliberately, maliciously, malevolently gone to work and sold that suit of clothes for 85 cents or something that I only wore about ten times last year?

That was the finest suit of summer clothes I ever owned in my whole life and I was so careful of it that—Well what d'ye think o' that! If I wore that suit more than fifteen times at the very outside last summer then I belong in Bloomingdale.

Why, I wouldn't take fifty dollars for that suit as it was on the day when I last took it off, and here, just because you happened to want sixty cents for caramels or something, you deliberately dragged it out and handed it over to a grinning old clothes man, without ever so much as giving me a thought! Well, well, well! And me looking forward to wearing that suit for two or three years yet, off and on!

How's that? I told you that suit never fitted me, and I threatened to sue the tailor because he wouldn't refund me my money on it, and I changed my tailor on account of it, and—

Oh, what's the use? WHAT IS THE USE? What kind of a ten cent dream book do you get all this stuff out of these days, anyhow?

Oh, there you go, sniveling, of course. That's the weapon you all use—tears.

As soon as you play all the hob you can, and perpetrate every infernal injustice on a man that you can think of, and he says a little word about it, you pull that tear stuff on him, and you're just crafty enough to know that it will win in about nineteen cases out of twenty.

How's that? I am unjust, and I pick on you dreadfully? Oh, of course. Of course I pick on you. I'm the abysmal brute. All I ask is a little bit of common consideration at your hands and you come out and say I pick on you

That's a pretty hard stab to take at a man, I'm telling you that. I'd rather have anything else in the world said about me except that I'd pick on a woman.

Oh, shucks, hon, cut out that crying business! There's no occasion for it. Everything's all right. Of course if you say you didn't say anything to me about my little game of poker, all right. It goes. It's got to go.

There, there. Come on now, buck up. I'm late for the office already. Say, it makes your nose as red as the dickens to do that, and I'd like to have you show me a woman that can make a hit with a red nose.

All right. I'll be back for dinner the regular time. And please have something fit to eat, won't you? That steak last evening was punk. All right. Good -bye.

O' course I wish I had that suit of clothes, but as long as it's—well, never mind, I'm going! Go dry your lamps—they're leaking!—New York Sun.

RECIPES.

The fig is one of our most healthful fruits and should be used more in cooking. It is easily grown in every section of California.

Preserved Figs.

Gather the figs with the stems on just before they are ripe enough to be eaten. Scrape off the skin carefully and drop the figs into a kettle of clear, boiling water, and leave half an hour. Then take out; allow to cool with the stems up. Make a sirup of a pound and a half of sugar and a half pint of water to each pound of fruit. Boil the sirup until nearly roping; put in the figs carefully and keep them under water while cooking. If other than natural flavor is desired, put a clove in the blossom end of each fig or cook them with a sliced lemon from which the seeds have been removed, adding a little ginger. The preserves keep well if made with an equal weight of sugar and figs.

Fig Preserves.

Gather the fruit when fully ripe, but not cracked open; place in a perforated tin bucket or wire basket and dip for one moment into a deep kettle of hot and moderately strong lye (some prefer letting them lie an hour in limewater, and afterwards drain;) make a sirup in proportion of one pound of sugar to one pound of fruit, and when the figs are well drained put them in the sirup and boil them until well cooked; removing, boil the sirup down until there is just enough to cover the fruit; put the fruit back in the sirup, let all boil, and seal while hot in glass or porcelain jars.

Lock the barn before the horse is stolen

Roof the barn with REX Flintkote Roofing before the hay gets wet, before stock gets sick, before a falling spark or firebrand sets the building afire. Get REX protection before, not after, you need it.

REX FLINTKOTE ROOFING

is made of long-fibred wool felt, treated with water-proof materials and fire-resisting compounds. The cost per year is so low that you simply can't afford to use any other. "Look for the Boy" trade mark.

We Send Free Samples

to show you how strong, how pliable and how fire-resisting it is, with a booklet to give you points on roofing. Thousands of roofs of all sorts, sizes and ages all over the country, prove the water-proofness and durability of REX Flintkote Roofing.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Hay.

There has been a marked diminution in hay shipments during the week ending today, the total showing 2590 ton in comparison with 3670 ton for last week. This was to be expected for the fields are being rapidly cleaned and very little hay can be marketed to advantage from the warehouses. The market naturally has an upward tendency at the moment for prices must advance at least $1.50 per ton immediately in order to cover storage and insurance charges on warehoused goods. Fancy wheat hay has been taken from storage for two or three weeks past and marketed here in small quantities to good advantage. The great bulk of the hay remaining in the country is not choice and it may be that we will have to wait some little time before prices will advance sufficiently to warrant holders in shipping average grade hay here. In all probability shipments will be withheld from the market sufficiently to stimulate prices and many speculators will probably hold until spring, hoping that some unforeseen condition may bring about a very material advance in prices. Should stocks of hay be plentiful during February and March it is quite probable that a material decline in prices will occur then.

Citrus Market

LOS ANGELES, Oct., 7. 1908.

Valencias are even better than last week in market tone and the few yet to go will probably be cleaned up in the next week or ten days.

Lemons are also stronger and selling very satisfactorily at present with good indications for the future.

Shipments.

Total shipments of citrus fruits since Nov. 1, '07, 29,022 cars of which 4651 were lemons. To same date last year 27,308 of which 3354 were lemons.

NEW YORK, Oct. 5.—Six cars Valencias and one mixed car of citrus fruit sold. The market is strong on good quality fruit. Weather clear, cool and favorable.

FARM NAMES.

Continued from Page 341

should be the one chosen. Every one of your names suggested is excellent. And the only criticsm that could be offered is that three names enter into each one suggested, though by constant use it might be that Meadow Brook, Willow Brook, etc., could be considered one word The personal preference of the writer would be the second one mentioned, except to leave off the word Home at the end and then make "Meadowbrook" one word. It is quicker spoken and more often referred to If it be a simple name and not too long drawn out. Other suggestions might be "The Willows," "Meadowbank." We will be glad if Mrs. Lanini will inform us as soon as the ranch name is decided upon.

FISH FERTILIZERS.

In the purchase of fertilizers every grower should be careful to assure himself, first that the fertilizer really contains the food elements properly prepared so that it becomes immediately available for the feeding of the plant; secondly, that he gets plant feed properties exclusively and not a large percentage of dirt which may be used to cheapen the cost of production of concentrated fertilizers. The fish fertilizer known as Wilgrow and manufactured at Port Angeles, Wash., while a comparatively new fertilizer in the California market seems to be meeting with unusual success.

Twice in the last three months the Fertilizer Control of California has taken samples of different sections of the State from the stock in possession of local retailers. In each instance the fertilizer under state test has been shown to contain a higher percentage of concentrated plant foods than was ever claimed by the manufacturers or required by the Control. It was also found that Wilgrow did not contain any alloy products; in other words there was no dirt or other product used to cheapen the cost of production; it was found to contain nothing but straight fish products and potash in their proper proportions.

TO SOUTH AFRICA.

Mr. Taft, of the Petaluma Incubator Company, while in Los Angeles recently, gave some points regarding the magnitude of the business of that big California institution. For instance, he mentioned a recent shipment of forty 48 ostrich egg machines to South Africa. The Petaluma Company claims to have a practical monopoly on ostrich egg hatching machines and the South African order is only a repetition of many which have been received before. Shipments to Japan, Australia, and other countries across the Pacific have been a yearly occurrence for several years. Notwithstanding the financial depression of the past few months the factory at this time is crowded to its utmost capacity.

A GOOD CULTIVATOR.

One of the best orchard and field cultivators amongst the many good ones that have been brought out in California is the Williams Goosc-neck cultivator manufactured and patent applied for by Williams & Son of Orange, California. This cultivator is especially adapted to orchard work, as thorough work can be done under trees, even under orange trees loaded with fruit, without injury to either fruit or limb. Orchardists will see the advantage of a cultivator with draft light enough for two horses which will extend well beyond the tree and cultivate close to the tree. Two horses will draw this implement with a nine foot cut and do so all day with ease. Its manufacturers say they believe no other cultivator has these advantages. A card addressed to Williams & Son will secure further particulars.

THE RISE OF THE GAS ENGINE.

The American public is so used to startling developments, that when one presents itself which involves a process of evolution, even though sweeping in its effect, the people must be educated up to a realization of what is doing before giving it any general recognition.

The latent energy of fuel has been used in so wasteful a way as to alarm scientists. No greater change making for the conservation of such energy has engaged the attention of the engineering world than the gas engine.

An illustration of the economics possible through the use of a gas engine driven pumping unit, when replacing steam, is the Poughkeepsie (N. Y.) pumping plant, rebuilt in 1905, with a 10-inch centrifugal pump, belted to a 35-horse power gas engine.

In the three months, January, February and March of this year, the steam plant pumping to filters used 223.59 tons of coal for 199.7 millions of gallons of water filtered, equal to 1.12 tons per million gallons. In the five months, July to November inclusive, the gas plant used 78.16 tons for 317.8 million gallons filtered, equal to 0.24 ton per million gallons—a saving of 0.88 ton per million gallons. As an average of 63.5 millions of gallons were filtered per month, the difference in favor of the gas plant was 55.88 tons per month, costing in the shed $3.26 per ton or $182.16 per month.

The total cost of this plant—gas engine, producer, pump, foundations, piping, etc.—was $3940.

It will therefore be seen that the coal saving alone paid for the entire plant in twenty-two months!

A similar result to this is found in numerous plants now in successful operation throughout the United States and Europe.

The development of the gas engine has progressed much farther in America than in Europe in the marine types. A company has built engines of 500 horse power, one in the schoone Northland, of 4000 tons capacity, and one in the excursion fishing boat Arion, which has a speed of 18 miles an hour.

The gas engine is the logical means for generating power for marine uses in the future, and from the steps already taken to equip vessels of different classes, it is only a question of time before the suction gas producer is universally adopted for both land and sea.—American Industries for September.

T-T-TWO OF A K-K-KIND.

A tall man, impatiently pacing the platform of a wayside station, accosted a red-haired boy of about 12.

"S-s-say," he said, "d-d-do y-you know ha-ha-how late this train is?"

The boy grinned but made no reply. The man stuttered out something about red-headed kids in general and passed into the station.

A stranger, overhearing the one-sided conversation, asked the boy why he hadn't answered the big man.

"D-d-d'ye wanter see me g-g-get me fa-fa-face punched?" stammered the boy. "D-d-dat big g-g-guy'd tink I was mo-mo-mocking him."—Everybody's Magazine.

PROOF.

Reggy—And is Gussie weally so effeminate?

TREE AND VINE CATALOGUE

S. W. Marshall & Son of Fresno have just issued their catalogue for 1908-09. It is filled with descriptive lists of deciduous fruit trees, nut trees, citrus fruits and vines. A department is also given over to ornamentals which is a most valuable feature. One interesting feature is an engraving showing 320,000 gum trees growing in an immense lath house. This immense number of trees will doubtless find a ready sale in a year like this when the eucalyptus is attracting so much attention.

OVERLAND.

The editor of the Overland Monthly recently remarked that he wished to make that historical magazine a "live wire" out here in the West. It certainly has accomplished many things in its long and useful life which already entitle it to the claim of being a very live proposition. Many literary productions like Bret Harte's "Heathen Chinee," some of Mark Twain's most noted writings and other gems of literature have first appeared in that magazine. It has now been singing the praises of this western slope for more than forty years and we trust will continue to make itself as live a factor as it has in the past.

ANOTHER BIG CONTRACT.

We are advised by the sales manager of the Pioneer Roll Paper Company, Los Angeles, California, that it has recently completed a contract on the Santa Fe round house at San Bernardino, California, on which Pioneer Rubber Sanded Roofing was used.

This round house is the largest in the west, the roof containing 70,000 square feet of surface space—requiring 700 rolls of roofing to cover.

The Pioneer Roll Paper Company will be glad to send their booklet "Roof Talk," free upon request.

CALIFORNIA BULBS TO EUROPE.

We note the following in a Santa Cruz paper. California uses some Dutch bulbs. We are glad to see the Dutch reciprocate.

A. Mitting has received from Holland a big advance order for Calla lily bulbs, which he will send to the continent the coming year.

He has an order for 2000 calla lily bulbs from M. Veldhauzzen, Van Zanten & Zonen of Lesse, Holland.

AN HEIRESS.

"You say you wish to marry my daughter. But she is only a mere school girl as yet."

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

The State Farmers' Institute at Davis

Editorial Observations Made at the State Farm, Where the University is Whipping Into Shape an Institution Which Will Be a Factor in California Agriculture

"THE discussion of these questions at this Institute, but more particularly the agricultural school conducted on these grounds, will enable coming generations to be greater than the present or past generations. We should be willing to make sacrifices that the coming generation may be great."

The above is a remark made by President Wheeler of the State University in his opening address at the second annual State Farmers' Institute held at the State Farm at Davis, in which he said he could not decide whether it was a welcoming address or a response to the welcome which had been given by other speakers. Probably the main thought in the addresses and discussions was the impressing upon the minds of those attending the great advantage to be had by young people of the present day if they will but avail themselves of the opportunities for agricultural education which this state is offering freely. Especially was emphasis placed upon the worth of the State Farm in this education. President Wheeler said that this is a new venture, there being no other in the United States exactly like it, and we trust it will aid greatly in educating our young in their lack of and need for an agricultural education.

To give special impetus to this work, President Wheeler said that the regents of the State University would take from their general fund this year more than $10,000 in excess of the amount which has been appropriated for the Agricultural College. The idea will be to make the school so broad in its scope that all features of agricultural science may be given their due attention and the President wished it understood also that the curriculum would contain instruction in the making of pumpkin pies, "one that can be eaten from the palm of the hand and like that our New England mothers made a generation ago."

Meager Attendance.

The attendance at the Institute was disappointing, although there were representatives from various sections of the state. But the attendance of the local people, that is, those of Yolo, Solano, and Sacramento counties, was by no means what it should have been when it is considered that a vast fund of information was there for the asking.

Prof. E. J. Wickson called the institute to order on the morning of the first session. The forenoon was given up to the addresses of welcome by G. W. Pierce of Davis, and Leroy Anderson, Superintendent of the Farm School. Members of the State Grange who were in attendance at the annual session at Sacramento were present in a body. One of the first responses to the welcome was that by F. H. Babb, Lecturer of the State Grange. President Wheeler, J. I. McConnell of Woodland, and others responded to the welcome.

Recent Advancement.

The afternoon session opened with an address by Judge Peter J. Shields, which we hope to give more largely from in a later Cultivator. In fact, among the many good things given at the Convention are papers which will either be quoted in full, or nearly so, in the Cultivator for the next few weeks. Judge Shields referred to the great advances of the past few years in agricultural knowledge, referring to the fact that many of the older ones present were born at a time when the farmers were cradling their grain and threshing it out with the flail used by the Egyptians at the time when Moses led the children of Israel to the Promised Land. The advancement in these points being within the memory of the oldest of our farmers of today cannot help but make us ask the question what will the next five or fifty years show in this agricultural advancement? It hardly seems that it can be so great along mechanical lines, but intellectually it should be greater than even the last fifty years have shown.

C. F. Curtis, director of institute and experiment station work of the Agricultural College at Ames, Iowa, was introduced by Professor Wickson as one of the best judges of live stock and promoter of agricultural education there is in this country. He had introduced Judge Shields as a Superior Judge of Sacramento county. He said he would now introduce Mr. Curtis as a superior judge of live stock.

In Iowa.

In speaking of the work of this state school, Mr. Curtis said that the Iowa school started in with a very small enrollment, which it had increased so that it has now more than 1,000, and the courses have been increased until there are now fifteen various courses. The attendants vary in age from 16 years to old, gray-headed men. One particular case he referred to where an old man who had decided to retire and move to town, became interested in the more scientific breeding and production of corn and is now one of the most enthusiastic corn breeders in the state of Iowa. Mr. Curtis said he did not know the California farmer yet, but he was greatly mistaken in his estimate of him if he did not take advantage of the opportunities offered by this school just opening and advance his own material prosperity by using the information which might be gained through it.

He deprecated the fact that the young man of the family who may have chosen to be a lawyer or physician or a preacher, is always granted the very best education which the means of the family can secure. While the boy who intends to stay by the farm is given only the hard work with no opportunity of culturing his mind so as to enable him to grasp the problems which are more difficult than those which confront the professional man. He urged that the short course be taken advantage of by the older men now engaged in farming, but for the younger men the full four year course should be given. "Do not expect the farmer to learn as much or more in one year than the professional man requires four years to learn."

It is impossible to give in the space at command a report of each of the excellent addresses made there, but as noted above we hope to give most of the addresses in full during the next few weeks. It is, however, in order to give somewhat of a description of the State Farm.

Ride Over the Farm.

Through the courtesy of Professor Clarke, a ride was taken over the farm and the improvements already made observed and points wherein additions are to be made to the equipment pointed out. Besides the old farm house and barns that were found on the place when it was bought by the state, there have been constructed nine buildings, which are now in use or will be in a short time. The dormitory for boys is nearing completion and will probably be accepted within the next few weeks. The dairy barn is completed but has not been accepted owing to some defective matters which the contractor has yet to correct. The barn is not built as a model for farmers, but with a view of being used for experimental purposes, and to that end has been more expensively constructed than most farmers will ever be able to provide for themselves. Floors are all cement with the manger of cement so arranged that it may be flooded and thoroughly cleansed. The gutters back of the cows are arranged so that perfect saving of waste is possible.

AUDIENCE IN PAVILION,, STATE FARM.

Box stalls are provided for calves and for bulls. The silo is not yet a factor. The barn is, however, filled nearly to the roof with alfalfa hay grown on the farm. No dairy cows have yet been added to the features of the farm, but, of course, will be as soon as the barn can be accepted and provision made for them.

A number of young heifers are in the corrals at the old barn, but these are being used to make a series of tests or experiments on tuberculosis. Half of these young stock have been made "immune" while the others are not immunized. With these young stock are a number of tubercudiseases may be conveyed from one to the other. lous cattle, all herded together in a way that the The idea is to determine whether these that have been immunized are less susceptible to the disease than the others.

With the Citrus Growers

CLEANING CITRUS TREES.

The season for successful treatment of black scale upon our citrus trees is now at hand, and it behooves us all who have any such infection in our orchards to at once complete our arrangements for its extermination, writes C. E. Bemis in Covina Argus. In young and vigorous trees this pest seems already to have its young brood fully hatched out, and this will be true on the older trees by September 1.

So excellent has been the work of our best fumigators in this valley for the past few years that it is a rare exception to find it necessary to repeat the treatment yearly if done in proper season, although many of our most successful growers think it profitable to do so. All growers who did not have their trees properly fumigated for black scale last fall should see that they are disinfected this fall. Your horticultural commission (Los Angeles County) is proud of the fact that the citrus growers of this valley (with a few rare exceptions) have never required that coercive measures be taken by the board for the disinfection of trees, our growers being fully alive to the importance of the best up-to-date practices in citrus culture.

Fortunately Covina has no red scale to contend with. The few scattering infections of purple scale must be fumigated immediately, as their eggs are now ready to hatch. Unlike the black scale the purple can be destroyed in its mature stage including the eggs, so we should not invite the danger of the spread of this infection by allowing the eggs to hatch, as nearly all kinds of these scale pests can be spread only in their crawling stage, immediately after the hatch.

Now a word about the townsites. Your present commission has been greatly commended for its policy of requiring trees and shrubbery in townsites to be freed from scale pests or dug out. Although some owners have thought our action arbitrary, all have been more than pleased with the results so far. Covina, Glendora and Azusa are next in order, and all infected trees within the townsites must be treated this season, and in order to have the work done as cheaply and effectually as possible, one or more fumigators should be given all the work at once, so it can be done consecutively and before the large orchard jobs are begun, as no one can afford to break into large work to do here and there a townsite with a few tents. Nothing depresses your visitors more than the sight of unkempt townsite trees, particularly where the best citrus conditions are claimed.

Scutillista is unusually prevalent, and it seems as if nearly every old black scale shell is occupied by this fine parasite, or shows the aperture from which it has emerged, and many will presume that they have destroyed all the scale. But wherever much scale occurred last year you will find upon the leaves at this time great numbers of the young scale, especially along the mid-rib of the leaf. Could the scutillista have occupied the field one month earlier than it did, scarcely any of the young would have escaped the little footless maggot, as the larvae of the parasite can feed only upon the eggs of the scale.

The Tulare Packing Company has been organized and will engage in packing seeded raisins.

ORANGE TREE MOVES NORTH.

"Botanists in the employ of the United States Department of Agriculture hope to bring into being an orange tree which will be as sturdy as the apple tree, an orange tree that will not perish in the chill of northern winter, which in December will bear its wreaths of snow and in May its garlands of bloom, and when summer comes will yield fruit as good as that sweetened in the south sun.

"This may seem to be an unnatural proposition, but it only seems so. No violence upon the laws of nature has been or will be attempted. It is simply an effort to make the citrus tree which bears the sweet table orange as hardy and insensitive to cold as the citrus tree which bears the bitter, unedible orange. By crossing a citrus tree which grows in the north and which bears an unedible fruit with the citrus tree of the south, it is sought to beget a plant in which will be combined the good traits of each.

"Government botanists are confident that the results of this citrus marriage will be a scion that will grow and fruit at a latitude midway between the northern limits of the sweet and the bitter orange. If this should be there might be orange groves in central Virginia, middle Kentucky, southern Indiana, southern Illinois, central Missouri and central Kansas."

The above is from a California Exchange and may chronicle something which will happen, but we think not. California once had an ambition to grow pineapples and bananas. A few may be shown as curiosities but commercially they will never materialize. Our climate decrees otherwise. "You can't farm against Climate" is as true as when uttered. New Yorkers wishing to step out in the back yard and gather a few oranges or grapefruit for breakfast need not defer locating in California hoping for the "acclimatizing" of a semi-tropical fruit to that section.

A citrus tree may be bred which will stand the colder climate, as to tree growth, but we imagine the fruit will be about as luscious as an osage "orange." You can't grow luscious oranges without luscious climate.

CUBA'S ORANGE CROP.

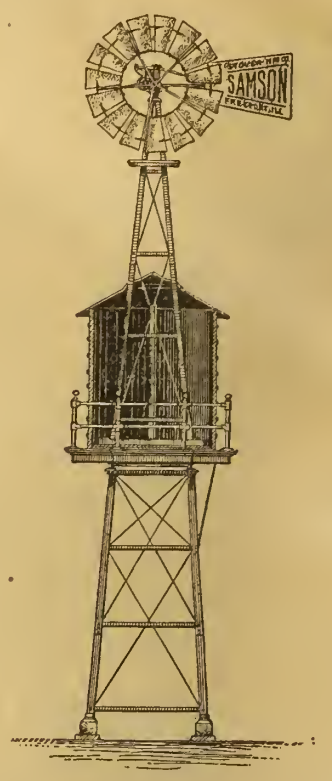
Consul Max J. Baehr of Cienfuegos reports that 500,000 crates is a conservative estimate of this year's Cuban orange crop, which will be the largest in the history of the island. Until a few years ago thousands of crates of oranges were brought to Cuba from Florida and California every year, but for the last three seasons these shipments have become less, and will possibly cease entirely within another year. Orange cultivation on a scientific scale did not begin in Cuba until about eight or nine years ago, and may be considered in its infancy, but is progressing rapidly, and even at this early stage is now in position to supply the local markets. The orange business on the island is controlled almost entirely by Americans.

The 35th Convention of the State Fruit Growers will be held in Sacramento the first week in December. Santa Cruz, Monterey and Watsonville aspired to the honor of holding the convention this year.

Prices of Tokay grapes have not been as satisfactory as they were last year.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Deciduous Fruit Culture

THE CONCORD WALNUT.

IT has taken many years to determine what varieties of walnut are best suited to California conditions. Southern California has had a practical monopoly in the production of this nut because certain selected seedlings of the early introduced Persian walnuts, from seed imported from Chili, have proved to be good bearers of an excellent market nut. Of these the Placentia Perfection is claimed to be the best, and the walnut groves of Los Angeles, Santa Barbara and Ventura counties are being largely grafted over with this variety. But like all of the type, it blooms early, making it liable to injury from spring frost and with a tendency to suffer from the walnut blight, a bacterial disease attacking the nuts and young growth early in the season, and before the weather conditions have become settled.

For the past sixteen or eighteen years government experts and later the Experimental Station pathologists, have studied the walnut in California with a view of suggesting a preventative, or remedy for this disease. The general conclusion arrived at, however, as gathered from the published reports, are simply and emphatically that the best, if not the only course to pursue, is to propagate by grafting and budding, only from those trees which are apparently immune from this bacterial disease, while being also prolific bearers of good, marketable nuts. Horticulturists of observation and experience, (among them the writer of this sketch) have long contended that this would be the only way out of the difficulty, and the discovery of the walnut here described is a realization of long deferred hope.

Its History.

Sixteen years ago, Mr. Geo. M. Wescott of Concord, Contra Costa county, bought an assortment of trees from the late Felix Gillet of Nevada City, who for a quarter of a century was the acknowledged authority on this Coast on nut culture. Among them was a "second generation" seedling tree of what Mr. Gillet called the "cluster" walnut which in time showed very marked individuality. This was seen in the heavy, luxuriant foliage, with rounded leaflets, and a disposition to bear early crops. The tree has proved to be a very heavy and regular bearer of those nuts which in the great markets of the world always command the highest price. They are large, almost round and smooth, a naturally clear color, well closed at the apex, and with a shell readily crushed in the hand, though not so thin that it would be broken in transportation. The meat has white skin and is of the best quality. It is distinctly of the Mayette or Grenoble type of walnut, the only type which in France is kept distinct as meeting in the fullest degree the requirements of the critical market. The Franquette, while also a standard variety, in France is not kept distinct as is the Mayette or Grenoble class. A glance at foreign market reports, as well as the testimony of investigators, is sufficient.

Mr. Ely I. Hutchinson of Concord owns one of the finest walnut orchards in Northern California. He has made the walnut a special study for years, and soon saw the peculiar advantages in the variety which we have named "Concord," grafting many native California black walnut trees with it. Mr. Hutchinson has Franquette, Mayette, Parisenne, Chaberte, Mayette, Placentia Perfection and other varieties in bearing, but of all these, none compares with the "Concord" as a money maker. The late Mr. Felix Gillet, in a letter to the writer, pronounced this nut the best of an assortment sent him, and, without knowing whence came these samples, he wrote that the sample which the sender knew as "Concord," marked with a number, was undoubtedly a seedling of his imported cluster, thus proving his keen knowledge and discriminating sense.

Its Special Value.

The California raised walnuts have so far been of the early blooming strain and peculiarly subject to attack by the walnut blight. On the other hand, the French varieties, produced in France after many generations of testing, by selection, and which are propagated there because adapted to the climate and producing also nuts of exceptional quality, in California, owing to our cool nights, are often retarded in maturing to such an extent that they do not ripen until they are caught by the rains in the early winter. The Franquette is particularly late.

The "Concord," growing among all other varieties for many years on Mr. Hutchinson's ranch, is practically immune to attack by the bacteriosis or walnut blight, does not bloom too early, like some of the Southern California varieties, and yet matures its fruit about the first of any, the hulls opening readily, allowing the smooth, white nuts to fall to the ground unstained, and requiring no bleaching. The tree has unusual vigor, its large, dark foliage being noticed a long way off, even when the tree is mixed in with other vigorous varieties.

No Seedlings Grown.

Mr. Hutchinson sells the nuts to the high-class trade direct; none of the nuts will be planted. The public therefore will not be offered seedlings, which, whether from Mayette, Franquette, or any other grafted variety, are seedlings still, and therefore absolutely unreliable. Nature occasionally offers a tree of exceptional vigor and which bears fruit or nuts of exceptional quality. These qualities are reproduced by budding or grafting from the original tree, but hundreds of thousands of seedlings may be grown before one is found producing fruit equal to that of the parent tree. All of the walnut orchards of Southern California were seedling trees until of recent years, when it was found necessary to begin the expensive work of grafting over the old trees. It will be so wherever seedlings of the Franquette have been planted.—Leonard Coates, Morganhill.

CLING STONES SCARCE.

The scarcity of the midsummer varieties of cling stone peaches such as the Orange, California and Sellers, is causing some uneasiness among the canneries in this section. In fact, in some instances the canneries have been compelled to close down temporarily until the peaches come in, or in other words, the canneries are working on part time so as not to work out the supply. The Gridley cannery has been compelled to close, the Chico cannery is running on half time, and the Marysville cannery of the California Fruit Canners' Association is working on part time as a result of this shortage.

Over in Yuba City the canneries are putting in full time, but are doing so because of the ability to get sufficient quantities of free stone peaches to fill in the gap. If the free stones should run out and the clings fail to put in an appearance as they are expected to do, there will be a compulsory suspension. None of the employes of the canneries have been laid off, but the emergency is met by working shorter hours.—Marysville Appeal.

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

Write us.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY

Manufacturers of Tanglefoot Fly Paper — Grand Rapids, Michigan

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

STATE FARMER'S INSTITUTE

Continued from Page 363.

Creamery Building.

The creamery building is now filled with machinery and is working on a regular commercial output of butter. The vats and appliances are there for making cheese, but none has as yet been manufactured. This is said to be one of the most complete creameries in the state and fitted in every way to turn out a high grade of commercial butter. This is being sold in the open market and at the same time it gives opportunity to the young men who are taking the dairy course to see the practical production, which now amounts to about 250 pounds daily.

The upper floor is given up to lecture rooms and offices, also a laboratory where the student, each with his own locker, is provided with apparatus and a table for his own particular use. The Babcock test and other experiments are performed in this room.

Below is the engine room with its 40-horsepower boiler and 20-h. p. engine. There is also an electric motor, and later will be installed a gasoline engine in this room. This providing of the three kinds of power is not for security so much as to have the different powers there for educational purposes with the students who will wish to know the manner of handling the various kinds of power generators.

In this room is also an 8-ton ice machine connected with the cooling rooms adjacent. There is cold storage for butter and cheese. In the main room are a number of separators of different makes and sizes, starter cans, cream ripener, churns, etc. In an adjacent room are cheese vats, presses, in fact, it is fitted for the complete instruction of students in all pertaining to butter and cheese making. Adjacent to this building is the octagon-shaped live stock pavilion, its tanbark arena surrounded by elevated seats, a view in which may be seen on this page. The purpose of this building is the holding of just such institutes as this has been, or meetings of like nature, also for a demonstration room in live stock judging.

Two cottages have been built, one for the use of Director Anderson and the other for Butter-maker Hageman.

The Farm.

The farm consists of 780 acres almost all of which is first-class valley land, chiefly a sandy loam and very productive. Most of it has been grain farmed and much of its humus at the surface exhausted, but this may be readily replaced and put in magnificent condition. It has an irrigation system with rights in the Yolo Consolidated Water Company, but this has proved to be of no value this dry year, as the supply has been so short that it is has not reached the farm at all.

The farm is divided into sections, a part of it being devoted to alfalfa production, others to cereal experiments and investigations, others to horticultural and viticultural departments, others to sugar beets, legumes, etc. One interesting lot of experiments consisted in irrigation tests. Part of this was the lining of ditches where excavations had been made in form like a large irrigating ditch. The first was left natural, as dug in the ground; another puddled and packed with clay; another with an oil coating; another with cement washed over the natural dirt; still another with grout or concrete surface. These, together with cost of production and maintenance and saving of water in each, will give a series of tables which will afford valuable data for the irrigation ditch builder. Other experiments are designed to show amount of evaporation from the surface of the soil under different treatments.

The cereal experimental plat has shown by far the greatest apparent progress; at least the most practical results were exhibited at the institute of the work of this one division. Prof. Shaw in charge with Mr. Gaumnitz, assistant, made a fine showing of the test grains, together with sheaves of the grain in the head. These experiments are calculated to show California farmers a more desirable variety of wheat, of barley and of oats than they are now growing. One variety, the Chulz, introduced by the University, is proving remarkable worth under California conditions. With the ordinary culture as given to California cereals in field production, this variety has shown a production of 51 to 63 bushels per acre. That is, we may say, with the ordinary field production, excepting that with this the ground was plowed to a depth of 8 inches and put in the best of tilth before the seed was sown. There was, however, no fertilization or irrigation, and some of the good results were obtained on land which has been used for years for the production of wheat. No distribution of seed will be made this year, though it is anticipated that another year the University will have several hundred bushels for distribution among farmers who will give it a thorough test.

Horticultural Plat.

Professor Clarke, in charge of horticultural and viticultural investigations, made a planting this season of several acres of deciduous fruits and of vines. Owing to the failure of the water supply the results are very unsatisfactory, especially with the vines. Most of the trees have lived and some show an excellent year's growth. A large portion of the vines have died or at least are making but indifferent growth. An old vineyard on the place at the time of its purchase has been retained and will be used in the experimental work. Part of this vineyard, which was badly infested with Phylloxera, has been grubbed out.

Several sections of the farm are blest with a good, healthy infestation of wild morning glory and will give ample opportunity for investigating methods of its eradication.

The Napa Canning Company has closed its cannery for the season. No tomatoes will be canned owing to overstocked condition of market.

INSTITUTE NOTES.

The students taking the dairy short course made a neat appearance in their white suits, which they are compelled to wear in their work in class room and creamery.

There are about twenty students taking the dairy short course and it is expected the other short courses will bring many more students to the farm.

The cottage erected on the farm for Director Anderson is not exactly palatial but withal a very comfortable little home.

One interesting experiment to be performed by Prof. Shaw and Mr. Gaumnitz is the bringing to California of soils from wheat lands in Kansas and Virginia. These soils are to be placed in pits in the cereal experimental plat, also another pit to be treated with California soil in identically the same manner, all three deposits then to be seeded with California grown seed. The object of this experiment is to determine whether it is California climate or soil which affects the milling quality of the wheat.

It is to be hoped that President Wheeler's wish to have a rolling Farmers' Institute conducted from a special train furnished by the Southern Pacific Company will materialize. The idea for this institute is for it to start at the extreme northern part of the state and take in many sections to the Imperial Valley.

Professor Major was in attendance but much the worse for getting in too close touch with one of the horses belonging to the Animal Industry Department of the College. He was "touched" so effectually that a cane was necessary to graceful movement.

California held 88 institutes last year at which there were 294 sessions with about 28,000 attendance. At these institutes there were about 24 lecturers and 90 volunteer speakers. The demand for these institutes is greater than the University Extension can supply.

The ladies of Davis reaped a harvest in putting up meals for the Institute attendants.

The Grange in session at Sacramento furnished an exceptionally large attendance on the opening morning. Members were present from nearly all sections of Northern and Central California. There are 35 granges in this state and five Pomona granges. They average about 80 men to each grange.

In beginning his speech Judge Shields, who is running for office this fall, apologized for his speech, saying that owing to conflicting reports regarding his success and failure, and charges often made against him, he had been unable to work his brain along agricultural lines, his hair getting all the exercise from rising and falling as reports favorable and unfavorable reached his ears. After listening to the paper the delegates generally concluded that his hair exercise brought forth fine results.

One of the pleasantest features of the last session of the Institute was an extempore talk by Professor I. P. Roberts, formerly of Cornell University. Professor Roberts talked on the need of humus in the soil and the wastefulness of California farmers in permitting many sources of humus to be dissipated by carelessness. Professor Roberts talks from expert practical knowledge as well as technical. He is author of "Fertility of the Land" and other books on farming subjects.

Professor Jaffa showed by his admirable presentation of work done by his department that many adulterated or mislabeled products had been cut out of California markets. Butter makers who had mislabeled their rolls of butter by stating that they contained a full pound, whereas they were several ounces short, were permitted to pay a fine of several hundred dollars to square the deal. The product most generaly adulterated and in which the greatest benefit has occurred is that of confectionery. A greater number of adulterations have been found along this line than any other.

Professor Shaw has 40 acres in many plats devoted to experimental wheat growing. These plats were planted last year to 63 varieties of wheat.

Professor Major was chairman at the Animal Industries Session and also made an excellent talk on the hopes and aims of the University along the lines of animal industry.

Professor Major spoke of his having attended the fairs in the central part of the state, especially at Tulare, six years ago and again this year. He said the stock exhibited now was vastly superior to that exhibited when he first came to the state. This improvement he maintained came from better knowledge of the good points of stock in which the farmers are educating themselves.

It is hoped that when the barn troubles are over on the Farm that a good supply of dairy cows will be installed and that hogs, sheep, beef and other stock will be added.

One point made by Professor Major in his address was that there were some animals with an exceedingly fine pedigree and at the same time an exceedingly poor animal. The farmer must be able to judge of the animal as well as the pedigree.

W. H. Saylor of the State Dairy Bureau gave an excellent review of the work of the Bureau in enforcing laws affecting dairies and creameries. There are about 6000 dairies in this state of which the means at command of the Bureau were so meager that but very few were inspected.

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

LIMA BEANS.

THE improving of lima beans was discussed at the recent Wintersburg, Orange county, Institute. At that time Dr. G. A. Shaw said, as reported in the Santa Ana Register:

"To improve the quality and increase the quantity of the yield per acre of beans from year to year, nothing is more important than the careful selecting of seed. Plant seed from your own locality, for it has become acclimated. Imported seed may not do well upon your land. For planting do not be contented with any seed that comes from the thresher. Your seed should be selected before the plants are cut. Usually farmers want beans that mature quickly, as these can be harvested before the early rains. Go over your field as the plants are ripening; you will find that some plants ripen and are ready to cut a week or two before others; from among the earliest to ripen select your seed. Choose those plants bearing the largest number of pods and the most beans to the pod. Harvest and thresh these plants separately, thus insuring the very best of seed for your next year's planting. This process may appear tedious, but it will be found to increase your yield 10 per cent.

Seed Selection.

The same method of careful seed selection is of great benefit, Dr. Shaw said, to the cereals also, and cited several instances where it had met with great success. "A careful selection of your seed will make a difference to any man, on any ground, in any year, of from two to four bushels per acre. In Vermont, where the most careful selection of seed has been practiced for many years by the growers of cereals, the average crop is 25 bushels to the acre, while here in California, where it is but little followed, 13 bushels to the acre is a fair average."

Dr. Shaw also cited conditions in Minnesota, where the careful choosing of seed and intelligent methods of culture had increased the yield of cereals to the value of $6,000,000 per annum, at an added cost of production of about $20,000. In Illinois, the same methods applied to corn have increased the yearly yield about $12,000,000.

Crop Rotation.

Dr. Shaw also spoke in praise of rotation of crops, and commended Mr. Hazeltine's plan of planting beets, beans and celery in successive seasons. After Dr. Shaw had finished his lecture he invited questions relating to the topic under discussion from anyone present.

"Are large beans the best seed?" was asked.

"Not necessarily," was the reply. "Large beans may have grown on a small, weakly vine with but few pods and few beans to the pod."

Another question asked was, "Do different varieties of beans mix?"

"To some extent," was the answer, "but not much."

"How many pounds of seed should be planted to an acre?" was a question.

"There is no fixed rule," Dr. Shaw replied. "Poor soil should receive more seed, the rows to be about three feet apart."

Another question was, "Will beans ripen quicker if planted more thickly?"

"No," was the answer; "a too thick foliage tends to keep beans green longer."

THE SUNFLOWER.

Helianthus—the sunflower—is a genus containing about fifty species of annual and perennial herbaceous plants, the whole of which are found native in America, the majority occurring in North America. Most of the species and their varieties are tall growing plants, producing large flowers yellow in color in their ray florets, the disc florets varying in the different varieties. The annual kinds are well known and popular garden plants of easy culture and ornamental value; among them are many improved forms, of which the miniature sunflowers are possibly of most value, producing as they do, quantities of flowers of moderate or small size that are very effective in the garden beds and useful for decorative purposes as cut flowers. Among the perennial kinds are many that are worthy of cultivation in any garden, the later raised florists' varieties being especially fine. Double and single forms exist in both the annual and perennial types, and although the color of the flowers is uniformly yellow there is a deal of variation in the different groups or varieties.

The common sunflower (Helianthus annuus) is a plant of considerable economic importance and is largely cultivated in Europe, Asia and America for its seeds. According to the Agricultural Ledger, 107, No. 1, an area of 216,000 acres is devoted to sunflower culture in Europe alone, the average return being roundly stated at about 50 bushels of seeds per acre. In Russia, where the sunflower is most extensively cultivated the seeds are eaten, raw or cooked, or used for the extraction of oil which is said to be excellent for table use, and may be substituted for salad or olive oil for all domestic purposes. The seeds are also of considerable value as food for birds, and are largely used in America for fattening poultry. The oil cake which remains after expression of the oil forms a valuable cattle food, being of great nutritive value and easily digested, while the leaves and stalks also possess highly nutritious properties.

From data derived from experiments and analyses of the plant it is evident that the sunflower requires a fertile soil, and that during cultivation it is also necessary to maintain the fertility of the soil upon which the plant makes considerable drain.

Soil and Culture.

Any fair garden soil is suitable, if well and deeply worked and manured Although the sunflower is a plant that will thrive fairly in poor soils, and with a limited supply of moisture, it is found that a moderate supply of manure and other good cultivation, to conserve moisture, or irrigation, is necessary to obtain maximum results. The soil for the reception of the annual kinds should be prepared some time prior to the season for sowing seeds in spring. The soil should be finely broken and divided before sowing, and the seeds sown at a depth of about two inches. The tall varieties are suitable for growing in masses at the back of large borders, while the miniature kinds should be alloted positions suited to their height—about two feet. Seeds of the miniature sunflowers may be sown in clumps, allowing six inches for each plant, but the larger varieties should receive much more room—one foot between the plants at least.

The herbaceous kinds are propagated from divisions of the old plants and from seeds. Seeds should be sown in spring and the young plants be set out as soon as ready to handle, to insure a fair season of growth before the blooming season. Divisions should also be planted in spring, the plants blooming so late into autumn that dividing at that time can only be done at the expense of the crop of flowers. Established plants should be divided and replanted into fresh soil in alternate years; if allowed to remain longer, the shoots become crowded and small and the blooms inferior.

One thousand bales of hops were sold to one party at Yakima, Washington, last week. Part of these were 1907 crop, which went at 3½ cents. The '08 crop is said to have commanded about 7 cents.

Purposes of University Farm

Address of Welcome at Annual Farmers' Institute, 1908, by Leroy Anderson, Director of State University Farm.

ONE year ago you were invited here to participate in the dedication of this Farm—to dedicate it to the purposes for which it was established—for the improvement of California's agriculture through the instruction and development of California's sons and daughters. Today you are invited to participate in the beginning of that instruction and that important development which shall grow and increase in beauty and fruitfulness during the years to come, and long after we, who have seen its beginning, are known no more among the living.

You are fortunate indeed to be here today to witness and to be a part of the commencement of an enterprise fraught with so much of good and of permanent value to our young manhood and womanhood. Some will tell you that the first object of this Farm is to improve California agriculture. That is one object, but how is our agriculture to be improved without first improving the men and women who are engaged in that agriculture? It is a true and accepted fact that no one can study agriculture without becoming improved in heart and soul, for no man or woman can come truly closer to nature without growing daily to be a better being. So let us look at this Farm as not so much land or so many trees or vines or horses or cattle or buildings or machinery, but let us look through them all and see what they all mean in building up the youth of our state—in making better men and women of your own sons and daughters.

You are seeing the beginning of one of the lines of instruction undertaken by the University at this Farm—that for adult farmers who are too busy in their every-day work to spend more than a few weeks away from home. On Tuesday morning of this week at eight o'clock, work began in the eight weeks course for creamery operators. More than twenty young men are now wearing their suits daily engaged in the various parts of a modern butter and cheese factory, and learning more of the science of it all than they had before dreamed was possible. Visit the creamery and watch the work going on.

On Monday next two more farmers' courses begin—one in Poultry Husbandry, continuing for eight days, and one in General Agriculture, lasting for three weeks. Some thirty men and women have signified their intention of registering in these courses, but the women are all with the chickens, and I am glad to say that the percentage of women is not small. The course in general agriculture is one that the general farmer needs. It includes irrigation, theory and practice, a study of soils, forage crops, growing grain and sugar beets. Many of you ought to remain and begin these courses on Monday.

Wednesday the 21st of this month will see the opening of the four weeks' course in Animal Husbandry and Veterinary Science. The schedule contemplates one week's study each on dairy cattle, beef cattle, horses and mules, and sheep and swine. A number of animals will be loaned by various breeders for this work to supplement the stock owned by the University. Study of breeds, breed characteristics, judging animals, and treatment of common ailments and injuries are among the interesting things inviting to the stockmen and farmers.

The day after election in November begins the three weeks course in Horticulture and Viticulture. Those engaged in the culture of fruits and vines cannot afford to miss this course, for every phase of the industry, so far as possible in so limited a period, will be touched upon by men and women who have been successful in the business. Propagation, planting, pruning, irrigation, harvesting, packing, marketing, insect pests and plant diseases will all be treated in a practical manner.

These five short courses are what the University is offering immediately for the busy farmer. About ninety have already sent in their applications for one or more of these courses, and I am expecting a total enrollment of two hundred before they are ended. Sometimes I get my figures too high, but there is one instance in which I never do. That is when making estimates for appropriations from the legislature. They are never too high and are always for just what is actually needed.

These farmers' courses mark one mile post along the road leading to the many points at which this Farm is to come in touch with the heart of the farming community, and there should be at least two hundred who shall take advantage of them. It may be that some of the courses are not long enough and that some are too long. We want a frank expression from those who attend as to what you think about it, so that there may be an improvement next year.

In January next we shall touch two more mile posts in this scheme of instruction. That is when you may send your sons of fifteen or more for a course of three years' study. We will give them instruction in a few academic subjects such as English and Mathematics and Civics and put them through the most approved course today known in agricultural schools. We will give them theory and practice in all the lines of agricultural activity; from milking a cow and filing a saw, to planning a barn and irrigating a field and making prize butter and cheese, horses and cattle. I know of no course so absorbing and interesting, nor so powerful in developing what is best in a boy than one like this.

The second of these two January, 1909 mile posts is the transplanting of Juniors and Seniors from the college at Berkeley to the soil at Davis. They are to have here the practical work which the college cannot give them at the University center. These men are to go out as teachers of thought and action in agriculture communities, and it is very important that they know the side of agriculture which they can obtain only on a farm like this.

The usefulness of the Farm in this particular cannot be overestimated. That experimentation will be conducted here, goes almost without saying. That is what the broad acres are for, and for producing the food the stock will need, and a big laboratory for all the students. Good instruction is not possible without scientific experimentation and investigation, and the Farm may be expected to furnish some of the best in the land.

I have been giving you dates of the beginning of three important branches of activity here, and I wish I might be exact about the time of beginning what I count even more important than any yet mentioned—work for women. It is to be regretted that women's work could not have begun at the same time with men's, but financial difficulties, chiefly, rendered it impossible and impracticable. If the legislature of 1909 does what we expect it to do, the dates for this can be announced when you come next year. This work is also for the busy housewife and for her daughter. Household science has so developed in these later years that full four year courses in college are given herein, besides short courses for busy women and long courses for girls of high school age. Possibly next fall we can offer a short course in household science for farmers' wives. This is the companion piece to the short courses for farmers which are taken chiefly by men, but to which women are welcome. The course for girls is a companion to that beginning next January for boys. The girls are taught the same essential academic subjects and, in addition, sewing, cooking, millinery, home management and sanitation, chemistry, botany, gardening, dairying, poultry and much else that is good.

I am sure you will agree with me that this is a future that is big in many ways and a big work for the University to accomplish here. On the walls of the pavilion you will see a drawing of the buildings contemplated for fulfilling this plan. If our plan for women's work comes to fruition, there should be a second group of dormitories—these for girls. The two groups will accommodate 500 pupils—a number of regular attendants not too great to be expected inside of ten years, which may be as soon as we can secure all the buildings shown. In addition to these are the barns for horses, sheep, swine, cattle and poultry which will spring up in the region of the dairy barn.

In welcoming you to all this and its beginning, the best we can hope for you is that you may take time to wander over the farm and dream a little of its possibilities; and in the wandering and dreaming be filled with some of the loyalty we feel for the great institution here represented, and with some of the enthusiasm we feel for its future; an enthusiasm borne of a proper conception of the largeness of the enterprise, a proper conception of all that it means of progress in the agriculture of California, and a proper conception of its power to develop the manhood and womanhood of California.

OLIVE OIL IN SPAIN.

Consul-General Frank D. Hill discusses the present status of the Spanish olive oil trade in the following report from Barcelona:

As a protectionist measure, the olive growers of Andalusia are petitioning the Central Government to prohibit the sale in Spain of all foreign oils, whether produced from oleaginous seeds or otherwise, likewise the sale of all oils mixed with olive oil.

Olive growing as well as vine growing and the cork industry are three Spanish industries that are in a high degree of productivity. Exports of olive oil reach about 18,000,000 to 20,000,000 pesetas (about $3,100,000 to $3,450,000) annually and in years of large crops twice those amounts. The oil does not, however, reach consuming markets directly, but is shipped from here to France and Italy—the largest foreign consumers—where it is refined, elaborated, and mixed with other oils and adapted to the demands of consumers in other countries. Formerly these countries took about two-thirds, at present about one-half, of the total exportation. Antiquated methods of extraction are now giving way to modern, and it is hoped that the tribute hitherto paid to French and Italian middlemen may be hereafter avoided and that the Spanish producer may by so much reap a larger reward for his work

Apple growers at Alviso, Santa Clara county, have formed an association known as the Santa Clara Apple Growers' Association. The association has already purchased eight cars of shooks with 6000 to the car. Some orchards will run as high as 1000 boxes to the acre.

Live Stock and Dairy

ONE COW'S MILK.

The milk of the family cow is usually divided into two portions, one for daily use and the other portion for butter. Now when the milk comes in have the milk intended for use put into a pitcher and the other for butter stored away in the pans in a cool place out of the dust. This is better than to keep it around any place like a pantry where people are passing through. The stripping from the cow, that is, the last milk, should be milked into a separate vessel and used as a cream for the coffee and fruit. This is better than skimming a pan for this milk. The skimming of the pan does not take all the cream from the milk but leaves some more to arise. This slower raised cream, often being only a thin coating over the milk, allows the air to pass into the mass and will be tough and wiry. Then it is troublesome to ripen and most of it strains out when the cream is put into the churn.

Pans or Separator.

I believe it will pay in labor saved to have a separator. I know that any one accustomed to separator cream can not use the ordinary pan skimmed cream in their coffee. It is on the turn and often has a slightly rancid taste that is far from pleasant. A separator is not more of an extravagance in the house of an educated woman than other machinery in use. A woman whose time is worth anything at all can easily use the time to better advantage than in skimming milk from pans. Really one of the worst wastes in this life is in educated, trained people doing unnecessary drudgery. I do not think any work is beneath any one; I think all work is alike honorable; but I know that much of the work the women do in the house is not necessary and a mother should be with her children and husband as a companion and not spend the hours in the kitchen that a few more appliances would prevent.

Cream.

The cream is usually quite turned when skimmed. It can be held in a cold place for some time—yet it will often grow bitter or rancid. I have found where this could not be controlled by temperature, that adding enough salt, not exceeding one ounce to a pound of the butter expected, would prevent bitterness, by holding that particular bacillus from developing so fast. Stir the cream from the bottom thoroughly when adding more to it. Keep in a cool place and do not add any cream to it for twelve hours before churning time. If the cream is not sour enough warm it. I use bottles filled with hot water and stir the cream. Or the jar may be set in hot water. Warm up to 80 or 85 deg., cover the cream for twenty minutes, then let it chill down. After two or three hours, if it looks satiny, tastes pleasantly acid and pits for an instant when the cream is dropped from the spoon on the surface of the cream, it is ready for the churn. Cool down to churning temperature.

Starters.

Where cream is determinedly sweet a starter of buttermilk may be used. The buttermilk must be good, or it will make bad butter. Where the buttermilk is not, use a starter of skim milk, take from the pans milk twenty-four to thirty-six hours old, that is clabbered and slightly acid, stir it into the cream and after twenty-four hours the cream will be ripened. Sometimes in warm weather it will ripen sooner. Now the whole process can be hastened, or the cream can be ripened by raising the temperature. Put in the hot water bottle and raise the temperature to 80 degrees and it will ripen quickly. Long churning is caused by three things—wrong temperature, unripened cream, and too full a churn. I always have a number of letters at this time of year on the subject of long churning. The cool nights that hold back the cream from ripening are the usual cause of the trouble.

Thermometer.

Do not be without a dairy thermometer; 25 cents will save wrinkles and worry. To ripen cream, the lactic acid bacteria are the ones that we need. When these develop rightly we have the sweet sourness that is desirable in the cream. The churn should be well scalded and then filled with cold water. Turn out the cold water and strain the cream into the churn. The straining will catch the bits of floating curds that may have been caught up by the skimmer from the pans. Now, good keeping butter should be from fifteen minutes to thirty in coming if the cream has been properly ripened and the temperature at churning time is right. Unripe cream will leave a lot of butter fat in the buttermilk. A low temperature will make the butter also slow in coming. When the cream is not ripe enough or too cold it will simply whip in the churn, but not separate into butter particles.

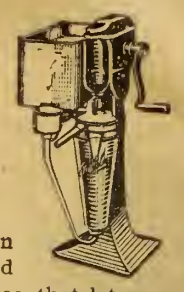
The temperature can be made right by using the cold water bottles. These bottles are smooth gallon bottles of heavy glass with small necks; they come filled with sulphuric acid for the Babcock test. They are strong enough to hold scalding water—and are perfectly smooth on the outside.

Butter.

When the butter reaches the size of kernels of wheat, stop churning and run off the buttermilk. Put in the plug and fill the churn half full with cold water. Rock the churn to float the butter in the water. Let it stand for a few minutes before running off the water, and salt while wet, one ounce or one and a half to each pound of butter. Turn the churn over to reach the other side of the butter with the salt. Let it stand again a few minutes until the water has dissolved the salt. Take the butter up on to a well-scalded butter bowl, wet with cold water. Work the salt in lightly, and stand away for a couple of hours. After that if it is thought desirable it may be worked again before being cut up into rolls. I do not work it but once, depending on stopping the churn when the butter is only the size of wheat grains and salting wet in the churn. This removes the buttermilk and puts the salt in it evenly. Working is only to do this and the less the individual grains are broken the better for the keeping quality of the butter. I usually finish the butter completely, right from the churn into the rolls. The only reason for putting it away to rework it is that it may be too soft to mould into shapely rolls. M. E. SHERMAN.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Don't Get a Notion



that you can run your dairy any old way—with the idea, that later on you will make up for the short comings.

MISSOURI MULE STORIES.

"The Missouri mule," said the western man, "is a creature full of character and temperament. Missouri is the great breeding state for the big work mules used throughout the southwest, and a team of them costs from $300 to $500. They are more valuable work animals than horses, for they are larger, stronger and will live on hay where a horse requires grain. They are also slower, more shrewd, cunning and obstinate than the horse. For instance, if a load is too heavy, the mule will not stir. A horse will strain at it until he breaks his harness or his heart. But the mule will stand impervious to any suasion, moral or physical. There is nothing to do but lighten the load. He will turn around and look at the load, also, and bray.

"The rubbering is a charaeteristic of the mule. If any one passes near his stall while he is eating, he will stop long enough to look around. A horse never does that. A mule will look around in order to aim his kicks correctly. The boys in camp used to have fun with on old mule who was an expert at this. They would annoy him from the rear, and he would look around, locate the annoyer and aim a kick like lightning in his direction. It was rather exciting sport, because not unmixed with danger. At 11:30 a.m., half an hour before work knocked off for dinner, regular as clockwork every mule on the job would begin to bray. They knew it was getting dinner time, and wanted to hurry things up a little. The horses never did that. But when the animals were let loose the horses would start off at a gallop for the grub pile. The mules, however, would not hurry themselves beyond a good walk. They knew the grub wouldn't get away, and they have fixed prejudices against haste.

"A contractor, for whom I worked in building a reservoir near Pueblo, Colo., had once met with an accident while riding a mule. He was alone at some distance from camp, and, through some cause which I now forget, fell off the mule and broke his leg. The mule rubbered around, saw his master on the ground, and stood perfectly still. The contractor was thus enabled to pull himself up on the animal's back and get to camp; while, if the mule had followed any other course, it might have resulted in very serious inconvenience for the injured man. Consequently the contractor always kept a soft spot in his heart for this mule, who was named Billy.

"When Billy reached an age which entitled him to a pension, he was honorably retired. The contractor, for some reason or other, took him to camp on every fresh job, though he never put him to work any more. Perhaps he thought Billy would enjoy being around in the scenes he was used to more than aristocratic seclusion in a lonesome pasture. At any rate, Billy did enjoy the life. At the camp near Pueblo he ranged the whole country free and independent. Frequently when the team from the commissary department went down to Pueblo for supplies Billy would come trotting along back with it. He would notice the team in Pueblo, or the outskirts, recognize it and join it for the home trip.

"After the reservoir was finished we went up in the high hills to build a railroad. The contractor was absent while supplies were being hauled by pack trains to a point far away from the road, and the men put Billy to work, although they knew they had no right to do it. At one point the trail wound along a narrow bank with a ledge of rock on one side and a precipice on the other. At the psychological point Billy's load tumbled over the precipice. It required time and labor to get it up and cinch it on to Billy again. The next day Billy's load went over the edge again at exactly the same point. Then the men gave it up. They saw that Billy knew they were imposing on him, and was cunning enough to breathe out when they cinched him up and breathe in when he got to just the right place to shake his load off On account of the partiality of his owner, Billy could not be disciplined by the underlings, and so afterward he insolently went up and down the trail with the rest of the train when he pleased, but with never a load."—Journal of Agriculture.

PROPER METHOD OF EXAMINING A SICK ANIMAL.

First take the temperature of the animal by placing a fever thermometer into the rectum, allowing it to remain there from three to five minutes. The normal temperature of a cow is 101 degrees (Fahrenheit). The normal temperature of a horse is 100 degrees, sheep 101 degrees.

Second, take the pulse of the animal, which can be found at the angle of the lower jaw bone. The normal beat of the cow's pulse is from forty to fifty per minute and that of a horse from thirty-three to forty per minute.

Third, count the respiration of the animal, or number of times it breathes by watching the sides of flanks, or by pressing the ear to the side. The normal respiration of the cow is from fifteen to twenty per minute and that of a horse is from twelve to fifteen per minute while resting. if the temperature, pulse, or respirations are found to be higher or faster than above described, you will know that the animal is ailing.—Dr. David Roberts, Wisconsin State Veterinarian.

AMERICAN NAVY'S BIG MEAT ORDER.

The United States Navy Department has just ordered 1,275,000 pounds of canned meats. This is the largest single contract for meat ever made by the Government in time of peace. It will require the slaughter of 28,000 head of cattle and 6000 hogs to fill the order; the meat, when packed and ready for delivery, will amount to about 45 carloads.

Prof. Major, secretary of the California Live Stock Breeders' Association, writes us as follows:

"A special meeting of the California Live Stoek Breeders' Association has been called for Saturday evening, October 17th, at 8 o'clock in the Chamber of Commerce, Sacramento, California, and all members and those interested in live stock are invited to be present.

"At this time there will be brought up for eonsideration and discussion a number of questions of very great importanee to the live stock interests of the state and all are, therefore, urgently requested to attend and take part in the diseussions. Do not forget the date."

DAIRYMEN

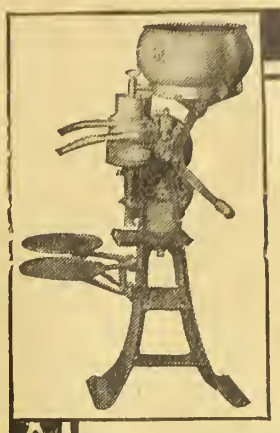
Your cows are either making money for you or eating their heads off.

Figure it out. Would it not pay to use less of high eost fodders and more sugar-beet-pulp at the low prie◦ of 50 cents per ton?

If it is milk you want you will get your money back with profit, besides you will improve the condition of the animals.

And don't wait too long before arranging to silo some of it for use after the faetory closes down.

Write, Los Alamitos Sugar Company, Los Alamitos.



TIME TO BUY CREAM SEPARATORS NOW

There never was a better time to buy the best of Cream Separators than right now.

The advantages derived from the use of the good Cream Separator are greater in the fall and winter than at any other time,—when the cows are old in lactation, the loss of butter-fat is otherwise greatest, and butter prices are highest.

Likewise are the advantages of the superior DE LAVAL separators greatest over imitating separators when the milk is hard to separate and the weather cold and variable,

In every case a DE LAVAL separator, of suitable size, will surely at least save its cost between now and July 1st next, and go on returning 100 per cent. per year on the investment for twenty years to come.

The agrieultural and partieularly the dairying outlook was never brighter and more promising.

WHY NOT BUY NOW?

INSTITUTE EDITORIALS.

We change the matter on this page this week and give to our readers thoughts picked at random from the addresses delivered at the State Farmers' Institute held last week at the State Farm at Davis, Yolo county. These thoughts touch various phases of agricultural life and we are sure will be appreciated by Cultivator readers, and it gives us an opportunity to say with all due modesty that this week we have an excellent editorial page.

The leading article on first page may be considered in a sense editorial as it gives observations made by the associate editor on the ground.

F. H. Babb, Lecturer State Grange.

The College of Agriculture is more necessary to the state than the Schools of Medicine, Law or Theology. If we lived a more natural life in the fresh air, we could get along without medicine. If we had no law or lawyers, we might get along with justice. If we had no theology, we could get along with religion. But we could not live at all without an adequate supply of food, and for that we are dependent upon an intelligent system of agriculture.

E. J. Wickson, Dean of College of Agriculture.

This effort to bring all the rural schools into closer educational relation with their industrial environment is advancing in California about as rapidly as it can successfully. Such work cannot be mastered as easily as the old lines of book subjects; it is vastly harder for the teacher to keep just a little ahead of his class, which is unfortunately the measure of the ambition of too many teachers. Just as soon as you give a child his liberty among things which surround him he is apt to drive his teacher up a tree at the first rush. Teachers must, therefore, be specially trained: they must at least know hat they ought to be able to explain and what the wisest man in the world would not undertake to explain. Teachers are preparing themselves for this work.

Prof. E. J. Wickson.

The University of California has the distinction of having a poorer agricultural building than any other University in the United States. It is forced to require thirty teachers and assistants to handle classes with an aggregate enrollment of 715 in a main building which cost $10,000 ten years ago, supplemented by a collection of sheds which have been enlarged and patched up until it is hard to tell what were their original forms and colors. And yet, both teachers and scholars are struggling on, full of interest and enthusiasm, because they have faith in the worthiness of their work.

Leroy Anderson, Superintendent University Farm.

Some will tell you that the first object of this farm is to improve California agriculture. That is one object, but how is our agriculture to be improved without first improving the men and women who are engaged in that agriculture? It is a true and accepted fact that no one can study agriculture without becoming improved in heart and soul, for no man or woman can come truly closer to nature without growing daily to be a better being.

Benjamin Ide Wheeler, President State University.

The great variety of activities followed in connection with the various investigations, to say nothing of the demand for space for teaching of classes, make it absolutely necessary that without further delay an agricultural building should be provided.

Prof. W. T. Clark, Director Farmers' Institutes.

The world, too, has been laid tribute to the demands of our people. Our horticultural history is a story of continued advancement, of continued improvement, of continued additions, and we today find ourselves heir to the results of the mighty efforts that have been made by those who have gone before.

Prof. Clarke.

When the man who has done great things shows us how he has accomplished his achievements we would be dull indeed could we not in some measure apply his methods to our practice, and so the mission of your University Farm to the horticulture of California is one of education—making the best practice of the successful horticulturist the common practice of those who choose to come and learn.

Mrs. M. E. Sherman.

The farmer and vineyardist earns his bread in the sweetness and peace of the quiet fields under the blue skies. It is blessed to live away from the daily grind of the ceaseless toil of the busy city and to be alone with nature in the enduring quiet of the country.

Mrs. Sherman.

It pays always to have the best and to do the best with it. I often wonder that anyone is satisfied to plant second quality trees or vines.

A. J. Gaumnitz.

The grain grower, like the dairyman, must first work out his environment both as regards soil and varieties. He must know his surrounding conditions first—and when he looks further he will find that as there are good, medium and poor methods of dairy practice, so there are good, medium and poor methods of farm management, and good, medium and poor varieties of grain, and as a good dairyman can double his profit on a herd of common dairy stock, so can a good farmer do likewise with his soils and common varieties of grain.

F. W. Roeding, Irrigation Investigations, U. S. Dep't of Agriculture.

There is nothing to prevent the early settlement of all the good lands throughout the Great Central Plains, and that this settlement is going on and increasing is largely due to the energy and enterprise of the various communities interested.

J. M. Eddy, Secretary California Good Roads Ass'n.

The public highway system of the United States has been a complete failure and is more than two generations behind the highway systems of the progressive nations of Europe. It is a failure, not because of public ownership, but because it has never been systematized, organized, administered, specialized, properly accounted for, and made uniform.

Highways carry the commerce of the country. They carry annually 250,000,000 tons of agricultural products. They carry fully fifty million people back and forth to their trading centers and daily avocations. They constitute the primary and most important avenues of transportation. As such they merit the best thought and best efforts of all the people all the time.

Owing to the wretched condition of rural roadways it costs us annually $125,000,000 more to move our farm crops to the shipping points than it would cost France, England or Germany to move the same number of tons the same distance. To save that annual burden of $125,000,000 extra cost would warrant us in expending two billion and a half dollars in road improvements.

J. M. Eddy.

Our public roads in California, 50,000 miles in length, embrace practically 400,000 acres of land and thus involve an investment of $40,000,000 for the land alone. Can we afford to permit any set of officials to administer a plant costing $40,000,000 without holding such officials to a strict accounting? I would have a provision in the law requiring every county clerk and every county auditor to open an account with every highway in the county and to charge to that account every expenditure on every mile of that roadway. The time, method, soil, material, weather, and cost of each and every mile of road construction, and the cost of care and maintenance each year should be a matter of record, and the Board of Supervisors and Clerk of our county assure me that it can be accomplished without extra cost if it be merely required by law and is properly inaugurated.

As an aid in reforming our highway service, along scientific lines, I believe that there should be a chair of highway engineering in our college of engineering in the State University. We need specialized engineers for this service, and they should have special training.

Judge Peter J. Shields.

Agriculture on thought alone is worse than agriculture on work alone. The finest results can only be obtained by a combination. You must think in your business of producing things. The extra product which the thinking farmer secures, more than does the farmer who merely works with his hand, is practically all profit. This institute should give inspiration which will lead to a combination of these essentials of success.

C. F. Curtis, Director Experiment Station Work, Ames, Iowa.

The agricultural population of Iowa is constantly decreasing. This is observed with great regret on the part of all well wishers of our state.

The effort now is to make farm life more attractive and to show that the problems which it offers for solution are as attractive and as worthy of best thought as any other problem which comes to us for solution.

C. F. Curtis.

The American farmer has left a trail of depleted land wherever he has passed. There is nothing sadder than the race struggling for existence on an exhausted soil

Shop Talk

SOMETHING FOR NOTHING.—On another page you will find an order blank for the use of new subscribers to the Cultivator. It provides that those using this blank who are not now getting the paper will receive it the balance of 1908 and all of 1909 for the regular yearly price of $1.00 It is an opportunity for your friends, relatives and neighbors and we will appreciate your suggesting it to them. Do it now. The sooner the order reaches us the sooner the paper starts.

Agricultural Notes of the Pacific Coast

Northern California

Vacaville shipped 946 cars of deciduous fruits up to October first.

A big tule fire did some damage in Yolo basin near Sacramento recently.

Sonoma county grape crop will not exceed one half of its last year's output.

Many farmers near Redding are abandoning grain farming for fruit farming.

The C.F.C.A. cannery at Yuba City has forwarded two carloads of canned fruits to Europe.

It is estimated that 3500 acres of Colusa county land will be planted to flax this season.

It is thought the planting of citrus fruits and olives in Butte county will be more extensive than ever before.

The 36th annual session of the State Grange of California was held in Sacramento Tuesday, October 6th.

The Santa Rosa cannery has done greater business this year than for several seasons, and is still running on tomatoes.

An owner of orange trees at Marysville has defied the white fly inspector and ordered him to desist from defoliating his trees.

Willows, Glenn county, will extend its irrigated land by sinking some thirty wells which will give an independent irrigating plant.

The orchardists of Butte county are standing together in the marketing of their dried peach crop and refusing to sell at prices offered.

Oroville and Wyandotte, Butte county, are discussing irrigation questions, which it is hoped will give to each a more satisfactory irrigation system.

The rainfall over the Sacramento valley is estimated to have done more good than it did damage. It was much lighter than in the southern end of the state.

Capitalists have recently acquired a ranch of 1300 acres near Colusa which will be planted quite largely to fig trees and then subdivided and sold in small holdings.

Yuba City and Marysville canneries are all closing after a very busy season. The three canneries there will produce over 200,000 cases of canned fruit.

The latest bill of fare at Santa Rosa which was at a banquet held by the Chamber of Commerce of that city was made up largely of cactus fruit supplied by Luther Burbank.

Winters, Yolo county, has a large apricot pit cracking plant which removes the kernel from the apricot pit, which is disposed of in Europe where they are sold as blanched almonds.

Most fearful forest fire which occurred in this state this year was that of Humboldt county. Several people lost their lives and vast quantities of standing timber and many buildings were burned.

A butter maker at Petaluma forwarded an exhibit of his butter to the State Fair for entry. It was awarded first premium but the fair management are unable to forward the premium because the letter was not written so that the name of the sender could be deciphered.

Central California

Fresno's recent fair was pronounced the most successful ever held.

The orange crop of Tulare county is reported to be a good average crop.

The raisin crop of Kings county will be much larger than that of last year.

A levy of taxes in the Turlock irrigation district was $2.80 per hundred.

Monterey is making an effort to secure extensive plantings of redwoods.

The Reclamation Service says the San Joaquin valley can be made to support a population of 20,000,000 people.

The Kings county fair which was held last week drew big crowds and proved more of a success than anticipated.

Salinas, Monterey county, dairy inspector found Salinas milk to run below standard, and some arrests have been made.

Monterey and San Benito county hay men have been embarrassed in securing sufficient cars to get their product to market.

Rice growing experiments near Stockton have proved satisfactory, and a more extended planting will be made in another year.

An extensive forest fire endangered the Lick Observatory on Mount Hamilton recently, but was controlled before great damage was done.

Earl Morris of Santa Clara county and Professor Woodworth have united to study into the problem of the destruction of the Argentine ant.

The $40,000 grape juice plant at Lodi, which started in operation but a few weeks ago, has been compelled to double its force and is now employing 42 men.

Tulare grange is working for the adoption of Senate Constitutional Amendment No. 1, which is the one calling for revision of our state taxation plan.

The Tulare county Horticultural Commission report that the only citrus trees infested with yellow scale in that county are the old citrus trees in the city of Visalia.

Rainmaker Hatfield is preparing to open a campaign to secure rain for the people on the west side of San Joaquin valley. His "experiments" will begin November 1.

Grape growers of Santa Cruz county have effected a permanent organization and will work in connection with the State Growers' Association. W. H. Galbraith of Santa Cruz is president.

A wool scouring plant is expected to be established in Fresno so as to be in operation by March. It will cost about $75,000, and will aid in making Fresno a large wool buying center.

Many raisin growers have refused the Armsby 4-cent offer. Only 35 per cent. of the growers signed up the contract, while the company insisted that 90 per cent. should come in. The time has been extended to Oct. 31.

The San Jose grange recently discussed the constitutional amendments to be submited for the decision of the people at the coming election. It was decided to oppose most of the amendments, at least numbers 14, 16, 24, 29 and 31.

Southern California

There are about 60,000 acres of oranges planted in California.

A Chino land and water company is shipping in cattle from Utah which are being fattened on beet pulp.

Beaumont is making a showing of apples this season without irrigation, which proves that to be a good apple section.

Riverside maintains in its Chamber of Commerce an exhibit of the fruits of that section which is an excellent advertising proposition.

Crafton, San Bernardino county, orange growers united in the ownership of fumigation tents and are disinfecting their own orchards.

San Bernardino County Horticultural Commissioner has found several widely separated sections of that county infested with Argentine ants.

The Rialto Orange and Lemon Association made its final clean up on last season's oranges by paying its members the sum of almost $15,000.

Fruit growers at Riverside believe that section adapted to walnut culture and considerable planting of walnut trees will be made the coming season.

Pomona walnut growers are complaining of the loss of walnuts occasioned by petty theives and are proposing to stop it by promiscuous arrests.

Coachella valley is planting heavily of winter cabbage expecting to get good prices owing to drouth in the East, causing small Eastern production.

Weather observers stationed near Salton Sea maintain that that body of water has made no appreciable effect on the humidity of the atmosphere of the Southwest.

The Pomona Times says that with very few exceptions the orange trees never looked more healthy and all indicate good care with a heavy crop of average fruit.

The plan of the Cawston ostrich people who have established a breeding farm at Winchester has been called off because wells which were sunk proved unsatisfactory.

Coachella Valley oranges are already coloring and that section claims it will be the first to ship California oranges this year. It is now estimated that November 10 will see the first car out.

Fumigators of orange trees at Redlands are doing thorough work so they not only kill the scale but one crew succeeded in killing twenty-eight chickens which were roosting in one tree.

The crop of fall potatoes now maturing on the new potato land recently opened up at Hemet is proving a record breaker as to quantity and quality, with a yield in excess of 100 sacks to the acre.

Imperial Valley melon growers are still endeavoring to gather themselves together in a co-operative marketing association. The following committee has been appointed to take up the matter and devise a plan of organization: Brawley, W. P. Mansfield; Imperial, S. M. Bixby; El Centro,, George A. Carter; Holtville, B. F. McLeod; Heber, I. B. Hoffman; Calexico, F. T. Thing.

The Coast

Nurseries at Milton, Oregon, advertise that they will pay $40.00 per ton for peach pits.

Rainfall to the extent of nearly 100 inches is given to many sections of the Hawaiian Islands.

One grower at Waverly, Washington, planted 100 acres of potatoes last spring and made a small fortune of it.

A Nez Perce, Idaho, farmer claims to hold the record with an average from his barley field this year of 82 bushels per acre.

The wheat which has not already been sold in the Walla Walla, Washington, district is now in the control of the Farmers' Union.

The Clarkston, Washington, Poultry Association is planning for a poultry show to be held in February, which will eclipse former efforts.

National apple show to be held in Spokane in December is being boosted more and more and the promise now is that it will be a great event.

Citizens of Asotin, Washington, are subscribing funds for the erection and fitting out of a packing house for handling the pack of that section.

The government anticipates the introduction of the mangosteen, said to be one of the most luscious tropical fruits grown, into the Panama Canal zone.

The Farmers' Union at Pullman, Washington, is to install a modern printing plant and newspaper to represent the interests of the farmers of that section.

Farmers near Waterville, Washington, are experimenting with planting different varieties of corn. In the past the corn crop has been unsuccessful in that section.

Efforts are being made to bring about the construction of a high line ditch at Ellensburg, Washington. This is a revival of an old irrigation scheme which has hung fire for many years.

Palouse, Washington, grain men are selling their wheat at the rate of 73 to 79 cents per bushel and oats at $1.25 per hundred weight. Nearly all of that section has been delivered at the warehouse.

The planting of rubber trees in the Hawaiian Islands which began in 1905 promises sufficient success that several companies have been organized to engage in the planting of rubber trees in the Islands.

Trees infested with injurious insects were landed on Hawaiian Islands from the transport Sherman at midnight but the watchful quarantine guardians secured and disinfected them before they were planted.

The apple growers of Walla Walla, Washington, are organizing to combat the advance in transportation rates and also to market their fruit. They hope to have a strong working organization before another apple will be ripe.

The Pacific National Live Stock Show held at Portland was one of the most successful in its history. The new grounds have been established at a cost of $150,000 and $40,000 were posted as purses and premiums. It is claimed to have the fastest track in the west.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN CHAT.

IT'S time to think about getting ready for winter.

While we don't have the cold and snow of eastern winters, we do have rains, winds and fogs, and our fowls must be sheltered, comfortable, and taught to roost in their winter quarters.

This is no easy matter, when they have been allowed to roost in trees, and if very many young ones are still on hand, perhaps there are not roosts enough without crowding, which is fatal.

To the Frying Pan.

Better dispose of every surplus cockerel now, if they have not already been sold, and give the feed and room to the pullets. There is an old saying: "As soon as a cockerel begins to crow, into the frying pan he must go," and there is much sound doctrine in that saw. Some scientists maintain that a pullet's first mating affects all her progeny in after life, and where pure bred stock is kept, it behooves us to get rid of cull cockerels very early, unless the sexes are religiously separated, which is not done on most farms.

At some future time I shall go into the discussion of the danger of allowing growing chickens to mix promiscuously, but it is too deep a subject for this sketch.

Houses.

Chickens do not need expensive houses in this climate, but three sides must be wind proof, and the roof must be water tight. The remaining side may be simply wire netting, faced away from prevailing winds, but see to it that the closed sides are tight. A knothole or crack may admit draft enough to give the whole flock their death of cold, for we all know how much worse it is to sit in a draft of air than to be right out doors.

In building our houses, we simply boarded and battened the three tight sides, and to keep out mites we painted each board and soaked each batten with distillate, and no mite has ever been found in one year's use. As we took the buildings apart to move them, we had a good chance to see whether the distillate really had done its work as thoroughly as we had hoped, and it certainly had.

Whitewash.

I don't like whitewash, noways. I got my eye full of it once, and it's very little I have ever used since. I did invest $5.00 in a spraying pump, said to be just the thing to whitewash with, but after wrestling with it until patience ceased to be a virtue, and discovering that I was getting a better coat of whitewash than the coops, I finished the job with a broom, and had the nicest whitewashed floor imaginable, so a bright idea popped into my head, and I called the men to turn the coops over from side to side, and by this means I managed to do quite creditable work. Strange to say, the men objected to this mode of procedure as a regular thing, so my "bright idea" about whitewashing coops has never been patented, but it is an all-right way for little coops.

Clean Up.

Having our birds warmly housed in clean coops, it is well to see that all go on the roosts at night, and then it is a comparatively easy mater to dust each one with a little powdered sulphur occasionally to keep them free from body lice. If given a good dust bath, they usually keep themselves reasonably clean, but some will thrive upon the backs where it is difficult for the fowl to dislodge them, and we owe it to our pets to help rid them of these pests.

The brood coops need a thorough fall cleaning, if not already put away, and a good scrubbing with boiling suds is effective as any way, after which a thorough soaking with distillate is in order. And mind the soaking is thorough, no half-measures will do any good here. Mites are like bedbugs, and harbor in cracks between boards, etc., and to dislodge them the distillate must run freely through every joint, or they will live to pester the life out of next year's broods of chickens, even zero weather failing to kill them, as I have found time and again, if a coop had not been properly treated before storing away. Nests should also be freshened up, and made inviting, now that the price of eggs is soaring higher than the new airships we are soon(?) to ride in.

California Is All Right.

Those of you who have never waded through the slush and snow of an eastern winter to care for hens, know little of the hardship this work entails. In this climate, outdoor work is delightful, and if a few simple rules are followed, poultry on the farm should pay so well as to furnish pleasant, profitable employment for all who are willing to work, but no lazy person need apply.—Mrs. Frank Metcalf.

KEEPING LAYING HENS IN CONDITION.

A hen that is producing eggs is a highly organized machine and must be kept in the very best condition all the time or she will cease to work, says a writer in Poultry. When we consider that a Leghorn hen, weighing from three and one-half to four pounds, will produce from fifteen to twenty-five pounds of eggs in a year, we will understand that she must have a good appetite and the good health that goes with it in order to keep up such a pace.

The contents of an egg shell and the shell itself must be elaborated from the feed she eats and besides she must eat enough to maintain vital action. From the feed the hen eats, she must get lime for the shell, oils and mineral matters for the yolk and albumen for the white. All of these must be transformed from the feed into the elements which constitute the complete egg. To be sure these elements are in the feed, but they must be taken into the blood of the hens, directed to the ovaries and transformed into complete eggs. All this requires energy and energy means the consuming—really burning up—of the nutritive element of the feed the hen eats. Take the case of a hen laying every other day, during ten months in the year. This gives her 150 eggs for the year and every day during ten months she must manufacture one ounce of egg in order to make her record.

In their natural state hens are omniverous, eating everything which

they find in the nature of berries, fruits, seeds, grains, insects and worms of all sorts and much vegetable matter in its green form. This kind of feed is found by searching in the forests and open valleys for it.

This is the natural feed for hens. Under domestication, about one flock in fifty get the feed most conducive to the production of the largest possible number of eggs. The well-fed flock of hens is a rarity. Most flocks get enough, that is pounds enough of feed; but it is not of the most profitable kind to feed them.

Indeed the most profitable feed for hens is not always the cheapest. Any feed which contains a large percentage of protein, from which the albumen or white of the egg is formed, is high priced. Wheat, oil meal, beef scraps, oats, barley, peas and similar feeds are all higher in price, pound for pound, than corn, kaffir corn, buck wheat and other carbonaceous or fat-forming feeds. The white of an egg contains but the merest trace of fat or oil, while the yolk has a large percentage of oil in it. This indicates that the fat-forming feeds are necessary but that albuminous feeds are also necessary.

In the experiments with men at Washington it was found that an exactly balanced ration was not always the cheapest, nor was it always apparently the best. It was found that men who were fed on a variety of food so as to keep the appetite in good condition were usually the ones from whom the best results were obtained. We may feed our hens the richest feed we can find; but unless we keep their appetites in shape by feeding a variety of feed, we will not be able to get results from them.

FATTENING FOWLS FOR MARKET.

Fattening fowls for market has long been quite an art in the old country, though in America this branch of the poultry industry is not given as much attention as is its due. Most of our farmers send their fryers and old stock to market without a semblance of fattening. This accounts for the fact that the up-to-date poultry plants can get more per pound for their products than the farmers, for the flesh of a fowl that has been fattened is more tender and juicy than that of one that has not.

In writing this article I take it for granted that you do not possess a cramming machine; that you have convenient quarters for fattening, and that you have the fowls to fatten. The next thing needed is the proper food. I use both mash and grain, feeding as much grain as they will eat up clean and then the same of mash. They will eat twice as much when fed in this way as when fed only one kind of food. Don't leave much food before them, as it will spoil quickly. The grain to be fed should consist of corn, oats, Kaffir corn and barley, their importance ranking in order named. The mash should consist of table scraps, cornmeal, melted fat and a little salt, mixed crumbly. If you can obtain it use skim milk to mix it. Where cramming machines are used the food is more in the form of soup than mash; however, this is not at all desirable where the fowls "do their own eating." Feed three or four times a day, cleaning the mash buckets after each feeding.

If possible have your fattening coops in a semi-dark position and away from other fowls. Small coops are best, as exercise is not desirable. Keep them clean and sanitary, for you would be only wasting food did you try to fatten in filthy quarters. And never under any circumstances put a diseased fowl in a fattening pen, for in close quarters disease spreads most rapidly.

Don't give condiments or powders to fowls that you are fattening. Supply green food and green-cut bone occasionally as a "dessert." Skim milk and clabber are highly relished by the fatteners, and will help them greatly both in amount and quality of flesh. Milk-fed chickens are greatly prized; therefore I might suggest that you add a bovine to your poultry plant for the express purpose of producing milk-fed fowls.

The Dorking is considered a fine table fowl, as are also Rocks, Wyandottes, Orpingtons, Games and Langshans. In France, where table poultry is seen at its best, the Houdans and Faverolles are prime favorites. But for some reason the French breeds, with possibly the exception of the Houdan, have never met with favor in this country. The English prefer white-skinned table fowls, and with them the Essex is first choice. They sometimes cross Games and Dorkings to produce plenty of breast meat, a quality which is much sought after in all breeds. But whatever may be your breed, it is neglecting opportunities if you do not fatten your fowls before selling—American Poultry Journal.

THE GROWING DEMAND FOR CAPONS.

Any delicacy for the table is certain to be demanded in larger quantities as the years pass. People are constantly becoming more luxurious in their habits and demanding more costly and delicate foods. Whether this is an encouraging sign for the future of the country does not concern us in this connection. We recognize the fact that the rich man's sons and daughters are not content with the plain and substantial fare of their fathers. They must have something better than their forbears were contented with in the way of food and drink. It may be possible that the time will come in this country, as it did in ancient Rome, when the rich gourmands of America will not be content with anything less than nightingales' tongues and cocks combs to set forth for their guests, but just at present the capon is considered good enough for even the most delicate and discriminating appetite, and for this reason capons are coming more into demand every year.

There has been no recent year when capons could not be sold at a price which would bring the producer a net profit of one dollar for each one. At such prices the man who raises hogs to sell in the market seems to be engaged in a very decidedly unprofitable business compared with the raising of capons.

One of the best things about raising capons is the fact that they are so easily satisfied. They do not care for extraordinarily warm houses nor are they particular about delicate feed. They have good appetites and the disposition to eat whatever is set before them in the shape of wholesome feed, without getting delicate about it.

A great deal has been said about the enormous size to which the capons will grow. About as much plain lying has been done about this as about anything connected with the capon business. It is a fact that capons usually weigh more than cock birds of the same breed but not as much more as is commonly asserted. We know

Excelsior Egg Food

Is an Egg Producer and a Money Maker. It keeps poultry in most healthy condition.

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will prepay freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

$50 Cash Prizes

$20 first, $10 second, $5 third, fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you, and no peddling or canvassing. And to each one competing we will also give a useful article. Send postal for particulars, mentioning this paper.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Coulson Poultry & Stock Food Co.
Petaluma, Cal.

Germain Seed Co., Los Angeles
Distributing Agents for So. Cal.

of a considerable number of Partridge Cochin capons which were sold at ten months old, weighing a fraction of an ounce over nine pounds each, a weight which they would have equaled as cock birds at the same age, had they been fed in the same way. While as cock birds these capons would have brought about eight cents a pound, they really sold for twenty-one cents a pound in the Chicago market, more than two and one-half times the price they would have brought had they not been caponized.

Cockerels should be caponized about the time they are from twelve to fifteen weeks of age. The operation is so simple that anyone can do it without trouble. All caponizing instruments are sent with full instructions for using them, and these are so plain and simple that it requires no previous experience to perform the operation perfectly. If a bird dies from the operation he will die within five minutes, usually. Death is caused by bleeding to death because the artery in the back has been ruptured. Such a bird is as good to eat as he would have been had he died from having his throat cut, as in either case death is caused by bleeding, so there is no loss if the beginner does happen to make a mistake. The best caponizers lose about five per cent of the birds on which they operate. These birds are always used as food.

It costs about eighty cents to feed a capon from the shell to the market. The amount received above this may be counted as profit. No one need to fear the lack of demand. There is never a minute in the season when capons can not be sold at good prices. —Poultry.

POULTRY QUERIES.

Sleepy Disease.

Please let me know in your next number what is wrong with my little chickens. They are about a week old and some of them have what is called, I believe, "sleepy disease." They stand around the whole day with their eyes closed and seem to be asleep and after about three days die. Please let me know if there is a remedy. Nobody seems to know anything.—F. S., Brawley.

Your chicks are probably suffering from head lice.

These attack hen-hatched chicks and cause the symptoms of which you speak.

Take some fresh, unsalted butter or lard, and thoroughly grease the heads and necks of both hens and chicks, and examine closely. This should be done when the chicks are first taken from the nest, and in nine cases out of ten, anywhere from one to eight large gray lice will be found upon the head of each chick. If your chicks are incubator babies, there is some error in diet causing liver trouble, but they seem to me to be too young for this to develop, so advise a thorough search for lice. —Mrs. Frank Metcalf.

Pullets Don't Lay.

I have seventy-five pullets all hatched last March. They are White Leghorns and are very healthy and in fine condition. They are not fat. I feed them grain in the morning, a mixture of wheat and barley. At noon they get milk, green food, meat and bone. At night I feed bran. They do not lay an egg. They started to lay but stopped. Can you tell me what is wrong? What can I do to start them laying? What is your opinion in regard to feeding tincture of Cantharides in the drinking water?—J. W. L., Corcoran.

If your pullets are growing healthily, with red combs and all the tokens of health and vitality, I predict a harvest of eggs very soon if you will change the night feed to whole grain.

One might give them each a handful of corn, the next wheat, and the next oats or barley. If they leave any, give some other grain next morning, and alternate the grains as often as possible, but give corn at least three times a week at night only, from now on.

I don't like to put any stimulating mixture in the drinking water. As the water gets low, the danger of an overdose is considerable, and I think it rather a cruelty to hens to deprive them of a drink of pure water by dosing it with this, that, or the other.

The best stimulant to start them to laying is red pepper in the mash, one teaspoonful to each dozen, fed once a week, but we all know that stimulants must be used with discretion.

Stimulants to hens, and whisky to human beings belong in the same class. They stimulate to undue production of energy for the time being, but "take it out" of the system later on, leaving it, or them, in a weakened condition.—Mrs. Frank Metcalf.

Died in the Shell.

What is the cause of chicks dying in the shell?—Mrs. L. B. S., Fair Oaks.

There are so many reasons "why chicks die in the shell" that I sometimes wonder how any at all manage to hatch. Of course, Prof. This will say it is due to some error in the management of the parent stock, and Prof. That will say it is due to deadly carbonic acid gas, which generates in incubators and also under hens.

Prof. Some-one-else will be equally sure it is due to imperfect ventilation, and each one brings in plenty of "proofs" to support their claims.

Meantime the chicks continue to die in the shells, just the same, and whether they die of one cause, or whether they die of another, the fact remains that they are hopelessly dead, and our profits go glimmering in proportion to the numbers of them that fail to mature.

One very prolific cause of weak germs is the use of more than one male bird in a pen; the reason is obivous. Another is filthy nests, which allow the eggs to become fouled, excluding the air, in part, from the germ, and also poisoning what does filter through.

Another way to kill chicks in the shell, is to handle eggs with greasy fingers, one drop of grease being sufficient to spoil an egg.

A neighbor of ours once found her hens lousy while sitting, she soaked those nests with kerosene, and waited for the chicks in vain. Dead in the shell.

Sometimes people fill the lamps before turning the eggs in the incubators and fail to thoroughly cleanse their hands before finishing their work. This method is a sure way to kill embryo chicks.

Of course, incubators sometimes register too hot or too cold for long hours and hens take vacations while sitting, also. Operators of incubators are often very much to blame for poor hatches, either willfully disobeying printed instructions, or else not understanding them, and the effect upon the helpless chick is just the same in either case.

In hatching chicks, we are dealing with the unkown and unknowable forces of life and death, and we may no more hope to solve these problems perfectly in this short life, than we may hope to read the riddle of eternity.—Mrs. F. M.

Chicks 10c and Up

Send today and get our price list on 19 varieties of thoroughbred chicks and eggs. Prices 10c and up. We can supply chicks in any number. Right now we are hatching several thousand per week. We ship them safely to all points on main lines in Cal., Nevada, and Ariz. Write us; we will be glad to quote prices. We are here to stay, and are the originators of the baby chick business in Southern California. Over 230,000 chicks, ducks, geese, and turkeys have been sold by us so far this year. Largest baby chick dealers in the world.

Didn't Feed Properly.

Will you please tell me, through the Cultivator, the trouble with my ducks. From the time they are hatched until they are 3 or 4 weeks old they are all right, and as lively as can be. Then they start to dying off without cause. They come from good, healthy stock. I feed hard-boiled eggs mixed with bread-crumbs and grit the first two weeks, then bran and sand. My big ones do finely on that, but out of 53 small ones I have 3 left. They are Indian Runner Ducks. —C. W.

This seems to be a case of starvation. Your baby ducks were filled, but not fed. Bran does not contain enough nutrition alone to support a growing chick, but is a valuable adjunct to other, more concentrated foods.

Had you added gluten in the form of low-grade flour, or even shorts, with a little corn-meal, the ration would have been more sustaining.

I have also found hard-boiled eggs unsatisfactory, and now use them raw, crushing the shell and all with the bran and shorts in the mash. Raw egg is a sovereign remedy for scours in calves, and is just as useful in bowel trouble among young fowls, whether ducks, chicks or turkeys.

Young ducks may be safely fed good, sweet corn-meal, if one-third bran is added to make it more bulky, and I have had excellent success raising them on this ration with plenty of green feed and fresh water. —Mrs. Frank Metcalf.

Sutter county alfalfa raisers are threshing alfalfa seed. Some of the better ranches it is claimed will net over $100 per acre, besides two crops of hay gathered from the same ground

The Ornamental Garden

THE ANEMONE.

ANEMONE is a genus of dwarf, perennial, herbaceous and tuberous rooted plants, indigenous to portions of Europe, Asia, Africa, and America. A large number of species is known; many are highly decorative, the flowers being of varied form and color, while others are of little value as garden plants. The average height of the tuberous rooted species is less than 1 foot, some of the herbaceous kind attaining a height of 4 feet. The so-called florist's anemones have been derived from anemone coronaria, the poppy anemone, a native of Southeast Europe, florists having raised from this species numbers of types and varieties that produce large blooms of varied form and coloring, combined with increased vigor in the growth of the plants and more profuse blooming. The anemone was at one period largely grown and freely exhibited, but like other garden flowers its cultivation, for some inexplicable reason, was abandoned for some time, but of late years the plant has again become a favorite subject of cultivators, chiefly on account of the excellence of some of the newly distributed types, of which the St. Brigid strain, Crown anemone, is a conspicuous example, the flowers exceeding in size and brilliancy those of the older varieties.

The tuberous rooted varieties are specially suitable for cultivating in places where water is scarce, a fine display of bloom being obtainable for little trouble and outlay. Anemone Japonica and its varieties are also valuable garden plants. The orginal species is a native of Japan, and in no way resembles the spring blooming kinds. The plants are fibrous rooted, herbaceous perennials, and the growth and flowers are produced during the summer and autumn. The flowers are white, and rose in color, and are borne in umbels on stems from 2 to 4 feet in height. Although classed as a hardy plant this anemone requires cultivation and moisture during the summer months.

Culture.

The most suitable soil for anemones of the tuberous rooted class is a moderately light loam which should be well drained to insure success. The addition of clay, or heavy loam to light sandy soils, or sand, ashes, or well decayed manure to heavy soils, will bring them to a condition suitable for the culture of these plants. They may be grown in beds specially prepared for them, or as patches or individual plants in beds or borders. The most important point in their culture is that no manure should come in contact with the tubers or even very near them, or their destruction is inevitable. In very poor soils some old and well rotted cow manure may be thoroughly mixed with soil at a depth of below 6 inches from the surface, but no fresh manure should be used. Tubers should be planted at a depth of 2 inches in heavy soils to 3 inches in light, care being taken that the crowns are placed uppermost. When the plants are grown in special beds the tubers should be set out in rows from 1½ to 2 feet apart, allowing from 9 to 12 inches in the rows for each plant. The same amount of room is advisable between each plant when anemones are grown to produce patches of bloom in beds or borders. Except in very dry places or when planting is deferred till late in autumn, the spring blooming anemones will not require any artificial watering during a normal season, and the only cultivation required is to hoe between the rows or patches, and keep the plants free from weeds. When the plants have finished blooming, and the stems and leaves are withered, they should be lifted, and after being dried, stored away until the planting season arrives. Plants allowed to remain in the ground will flower early in winter, but fine weather is essential for the production of blooms of good type and quality.

Anemones of spring blooming types are increased by dividing the tubers, and from seeds. After the plants are lifted and dried, they should be divided, before storing, into pieces, each containing one or more eyes or buds. Seeds should be saved from the finest types and flowers, which may be cross fertilized with ease. The anemone produces seeds freely, the seeds being clothed with a woolly covering and clinging together. They should be separated before sowing, the easiest way being to mix with them a quantity of dry sand or other gritty material, and rub them until they separate. They may be sown as soon as ripe, in small beds or boxes of fine soil. The young plants soon appear, and should be kept free from weeds and watered during dry weather, which will enable them to develop into fair plants, many of which will flower during the same year. After dying down they should be stored and replanted in season; when the tubers are very small, sifting from the soil is the common practice. If a good selection of seed is made some fine varieties may be produced. —Journal of Agriculture, New South Wales.

If not already sown, seeds of perennials and of many hardy annuals may be sown in a protected place this month. After preparing the soil, sow or plant the seeds, water well and cover from the hot sun until the plants appear, then gradually uncover.

After a shower, or when the foliage is wet, give the rosebuds a thorough dusting, on all sides, with sifted wood ashes. If this is done, whether insects appear or not, it will save trouble.

Never let the soil get dry, and protect from sun and wind with either cloth, paper, or lath frames. The secret of success with late summer planted seeds is shading the plant bed and giving moisture until well started.

Nearly all plants thrive best if given plenty of breathing space, either by spacing when transplanting, or by pruning off the side branches. Many plants give larger and better bloom for this vigorous lopping off.

Give a lawn a dressing of fertilizer in midsummer. If you have no old, well-rotted manure, get the commercial fertilizers, as they are not expensive, and be liberal with them.

Don't let the garden go "ragged" this month. Pull and burn every weed you can reach. Remove all dead stalks and dried leaves from the flower beds.

Pile potting soil in the sun to sweeten, turning often.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Farrow Cow.

I have a cow which I expected would be fresh about the first of September. Consequently dried her off during August, though she was very hard to dry off, owing to giving so much milk. I find I am mistaken, as she is not with calf and is now very fat. She is now giving only about half a pint of milk at each milking. Am feeding bran mash and working with udder in effort to bring her back to her milk. Can you suggest anything to help me so that I will not have to wait ten months with a dry cow on my hands?—P. J. M., Florence.

I fear it will be quite impossible to bring a cow that is distinctly farrow back to milk flow. When an animal fails to breed and grows fat, we usually consider her usefulness past as a dairy cow. The only thing I could suggest would be to give her a calf to nurse. This might start the milk secretions, as it does sometimes in heifers that have never been bred.—M. E. S.

Wounded Cow.

I have a cow seemingly in the best of health, giving her usual amount of milk. About six days ago a watery, sticky fluid came through the hide on her hip. It dried up the next day but three days later came out on her shoulder. That has dried up and it now has come out on her leg. It is a little yellow and when dried up a little purple; sticky when wet. The cow keeps well, does not fail in milk, has no swelling at all. She is two years old. Please state through your paper what you think it is and whether her milk is good to use.—P. S., Tulare.

Do not know, but would look around for something that the cow punctures herself on or something that makes bruises. If this was on the glands of the body, as the milk glands, one would think it best to test her with tuberculin.—M. E. S.

Agricultural Schools.

Will you please give me the name and address of some agricultural school in California?—H. J. C., Laton.

The only agricultural college in California is that at Berkeley connected with the state university. Connected with the same institution is the Agricultural Farm or School at Davis, which will not open until January 1. There are now in session at that farm the short courses. In regard to the above write Prof. E. J. Wickson, Berkeley. The State Polytechnic School, which has a strong leaning toward agricultural education, is located at San Luis Obispo.

Bermuda.

I would like to know if Bermuda grass is good feed for a milch cow. I have a watered, green, pasture, and in addition my cow gets a small forkful of alfalfa twice a day. She is a high grade Jersey in good condition. She does not milk so well as she did last winter and the fore part of the summer. I get only four quarts at a milking. She did better till within two weeks of the time she was fresh. We have fed potatoes part of the time but she has not increased any.—A. C. B., San Jacinto.

Bermuda is often too short for cows to make much milk. Potatoes are of little account as food, being more in the nature of lightener of diet. Increase the alfalfa hay and she may increase in milk yield. Many cows, however, have off years in milking. I had one cow that used always to give less milk every few years so that we were almost tempted to make beef out of her, but in her regular season she would give enough to make good her losses.—M. E. S.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Walnut Bleach.

Can you inform me as to the new walnut bleach for walnuts as published recently?—Subscriber, Anaheim.

The bleach is claimed to be very effective, and many of the associations here signed up for the installation of the plant this year. More would have done so had it been possible to secure the appliances necessary. It is thought that by another year nearly all will be using this method.

Sorghum and Mangels for Feed.

I have been a reader of the Cultivator for many years and think it the best paper published on the coast. I find its query columns of great value. Will you kindly answer, does mangel wurtzel make good hog feed? Is sorghum a good milk producing food and how much can be grown to the acre in good, black soil.—F. T., Los Olivas.

The mangel does make an excellent addition to the diet for hogs, more perhaps for its beneficial effect upon the health than because of its food content. Regarding information about sorghum would refer you to Mrs. Sherman's article on page 249, September 10. In that it will be seen that it is an exceptionally valuable feed, especially valuable in a year like this when the dry season is so long. It grows slowly at first but when thoroughly rooted grows more rapidly. We cannot give the tonnage but an exceptionally heavy yield is given by feeding or cutting, as it stools out and makes a new crop from the roots.

Eucalyptus Seed.

When is the proper time to gather eucalyptus seed and how do you prepare it for sowing? Is seed gathered from trees planted one year ago last spring as good as from older trees?—R. B. H., Tulare.

The proper time to gather the seed from eucalyptus is when fully ripened and no preparation is necessary for the sowing, other than to dry the pods so the seeds will rattle out on the sheet or tray on which they are drying. We would prefer the seed from older trees.

Stock for Walnuts.

Would you recommend grafting English walnuts on black root or is the ordinary soft shell root better, where they are to be planted in a canyon in the mountains? The land is not adobe and holds moisture well, but cannot be irrigated. Is the black root graft an experiment? Or has it proved all that was expected of it? Does blight affect walnuts as much in the mountains as in the valley? Does extreme heat affect this tree? The land in question is fifteen miles from the ocean, soil rich, chalky in formation, has raised a good crop of lima beans. What will it cost me to plant it?—A. P., Oxnard.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

We cannot answer all your questions, but will refer them to experienced walnut growers. Would say, however, that the grafting on the black root is no longer an experiment and has been successfully done in many fine orchards. As to which is the best it is impossible to say as there are diverse opinions on the subject. If the canyon in question has any native walnut trees growing we would surely graft on them as they stand. Some nurserymen and planters prefer the hybrid walnut, produced by Luther Burbank, as a grafting stock as it grows a larger and thriftier tree. If the land is where there are fogs or where the moisture is very continuous in the spring time, there will be more injury from blight in the dryer, warmer valleys.

Garget.

Will you kindly advise me through your columns as to the best treatment for a cow coming in that has been subject to garget before?—Subscriber, Pasadena.

Feed no grain for two weeks before calving. Twenty-four hours before she comes in give her a pound of Epsom salts with one ounce of ginger. After she calves keep her warm and repeat the salts a couple of times. Milk carefully and avoid heavy feeding. Keep the udder soft by the use of vaseline mixed with lard.—M. E. S.

Pruning Loganberries.

I have Loganberry plants which have two summers' growth since planted. Please tell me how to prune so as to secure the greatest returns next year. Also how should I prune next summer or will no more pruning be necessary until a year from this time? Is it best to trellis them?—H. A. S.

Hardly any two growers pursue the same method with the Loganberry. Many advocate training them on a trellis but I have always thought it a great waste of labor—except possibly in small gardens where space is limited and only a few vines were grown. If your plants have gone two seasons without pruning there will be first the old wood of the first season's growth to cut out, and the past summer's growth should be thinned out aud shortened back. How much thinning and how far to cut back will depend somewhat on how far apart the rows are and how far the plants are in the row. I have been very successful in growing them in rows about 6 feet apart with the plants 6 to 8 feet apart in the row. Thin to 6 or 8 best canes and cut back to the length that will equal the distance between plants. Then bend half the number of canes each way from the hill, along the length of the rows, allowing them to lie upon the ground. Sometimes it is necessary to drive down a light stake—a piece of lath will do—to keep the canes in place. If this is done by February the fruit spurs will all grow upward toward the light, making the fruit easy to pick.—Q. A. L.

RESULTS OF THE AUSTRALIAN EGG LAYING CONTEST.

The South Australian Egg Laying Contest during the twelve months ending March 31st, 1908 resulted in a wonderful egg record. There were 78 pens of six fowls each that took part in the competition The leading pen, which was white Leghorns, laid 1531 eggs during the twelve months, an average of better than 255 eggs each. The second pen was but three eggs behind. Of the 20 leading pens, all of which were above 1180 eggs, 14 were white Leghorns, 3 were Black Orpingtons, two Silver Wyandotte and one white Wyandotte. This contest was held under the auspices of the Agricultural College.

Warranted to give satisfaction.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

203-4-5 Union Trust Bldg., Corner Fourth and Spring Sts., Los Angeles Cal.

The new levee in district 777 near Live Oak, Sutter county, is nearly completed.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Wind Puff.

I am offered three-year-old colt, said to have small wind puff on one leg from strain. I would like to ask, if it is curable, what to use for it. If cured will it come back later on? And if not cured, will it likely get larger?—L. D. H.

Yes, they are curable. Use Tincture of Iodine on puffs, cover with cotton and tight roller bandage. Change once daily. Yes, they will probably come back again. They will get larger.

Scours.

I have a horse which has a bad case of scours which has become chronic. Have tried change of diet, using different kinds of hay, but failed to cure. Can you help me through the Veterinary Department?—R. S., Hemet.

It is often very difficult to control. Thoroughly cured alfalfa will usually help. Give astringent in feed. One to two drams of Tannic Acid in feed twice daily. If he refuses to eat, wrap it in a piece of paper and put it down his throat.—R. T. W.

Eruptions.

Please tell me through the Cultivator what to do to cure my colt of rubbing and gnawing herself. Her neck, shoulders and legs are all spotted, the hair has fallen out of spots, her legs are full of little lumps, and she bites them until they are raw. I know that I have over-fed her, but for the last two months I have been reducing her feed considerably. All the food she gets now is chopped pumpkins, morning and afternoons, oat hay at night. Twice a week I give her a bran mash with sulphur in one and salt peter in the other. She does not rub and bite herself quite as much now as she did some time ago, but she does lots of it yet.—T. I. W.

Your system of feeding is all right. Rub coal oil into affected parts two or three times weekly.—R. T. W.

Rubbing Tail.

What causes my mare to back herself up against the fence and rub the hair off her tail? What is the remedy for it?—H. J. W., Pasadena.

Either pruritis or Ascaris equorum. For the former, use ordinary coal oil well rubbed into the tail twice a week. For the latter give strong saline enemas daily for a week.—R. T. W.

What was It?

We have a mare eight years old and always in good condition until a short time ago she began to grow thin until she was nothing but skin and bones. She was in this condition about two weeks and then took to eating and is gaining rapidly.—C. E. L.

Did she drink or not? Were her bowels loose or not? Did she have any fever at time she commenced to get thin?

Did you examine her teeth at any time? Did you feed her all she wanted to eat at all times?

There are a great many diseases that will make a horse loose flesh. You have given me no symptoms to judge as to her trouble. Did she eat all this time or refuse her feed? Did she chew it or not?—R. T. W.

Subscribers must give some information as to condition if any information is to be given in return. The fact that a horse or other animal was sick and died or sick and got well is no diagnosis which will enable a physician to write a prescription.

IMPORTANT MEETING.

All over California the "get together" movement is becoming more evidenced with the passing of every day. In counties the people belonging to various commercial organizations are realizing the advantages of co-operation and they are forming county organizations, and these, in turn are combining in district organizations. Regular meetings of these district organizations have done much to bring about a closer bond of sympathy and mutual interdependence among the various parts of the State The idea of co-operation and mutual work is carried to its conclusion as a State building factor in the semi-annual meetings of the Counties' Committee of The California Promotion Committee, where all the counties have representatives who meet to talk over matters that mean much for State development.

At Los Angeles the tenth semi-annual meeting will be held on Saturday, November 14, and much of interest will be brought out in the discussion of the general theme of "The Tourist in California." Prominent speakers will be present, among them being F. H. Newell, Director of the United States Reclamation Service who will tell of what has been done and what will be done in California by his department. Director Newell's address will be illustrated by his famous stereoptican views.

A special train will carry the delegates from the interior valleys, the coast cities and the San Francisco Bay region and will leave San Francisco for Los Angeles via the Coast Line, on a daylight run over the Road of a Thousand Wonders.

HAVE YOU TRIED LIME?

A good many people write us complaining that their alfalfa starts out all right but soon begins to look yellow and finally dies out. One or two things, may be both, is the cause in such cases. Either the land lacks lime and is sour, or it lacks the natural bacteria that the alfalfa must have. Our advice in such cases is to put about 30 bushels of water-slaked lime to the acre, on that soil and immediately after sowing scatter say from 500 to 1000 lbs. of soil from some good alfalfa field to inoculate it. In Indiana they are using large quantities of raw limestone rock ground fine, spread about 8 tons to the acre on land that is too sour to grow clover or alfalfa well. They say it is producing fine effects. It costs, we believe, about a dollar a ton. Very often an application of acid phosphate say 500 lbs. to the acre, helps alfalfa greatly. It is not a good thing to manure alfalfa much after it has started to grow. If manured at all, none but the fine rotted article should be used. But we are certain that there are a great many farms where the soil is too acid and needs the lime as suggested. —Hoard's Dairy.

The picking of wine grapes has practically discontinued so far as the first crop is concerned and at the prices which have prevailed it is probable that the second crop will not be gathered.

SELLING THE FARM.

Well, yes, we settled, ma and I, that
we would sell the farm;
We are getting on in years and toil
has somehow lost its charm.
So we said we thought it time to lay
some of life's burden down,
And the married children thought we
ought to buy a home in town.

Well, a purchaser come right along,
for I'll own, I'm free to say,
That a better or a prettier place you
might search for many a day,
With its fertile fields and wooded hills
and meadows lush and green,
And buildings snug and neat and trim
as any ever seen.

But it's strange how old familiar
things will twine around the heart,
And we never dream how close they
cling till we sense that we must part.
And when it comes to business, sir,
that's what I meant to tell,
We found a precious lot of things that
somehow wouldn't sell.

There's the willow that ma planted
some forty years ago;
It has grown into a mighty tree with
branches drooping low.
And the children played beneath its
shade when the days were long and
warm—
Now I wouldn't sell that willow tree
for the price of this old farm.

And it's curious how we grow to love
the things we plant and tend —
Every tree in that old orchard seems
just like a human friend.
And I couldn't help but meditate how
we'd miss them, ma and I,
That tree of Golden Pippins and the
hardy Northern Spy.

And then the precious memories that
cluster 'round the place—
They seem to fill these homely
rooms with beauty and with grace.
We could seem to see the children
flitting blithely here and there,
And to hear their merry voices calling,
calling everywhere.

Then one day I found ma sitting by
the rose bush at the door
With the wistful look upon her face
I'd noticed there before.
And I just dropped down beside her
and she looked up at me,
And something blurred our dim old
eyes till somehow we couldn't see.

And then we settled, then and there,
that we'd stay on this old place
Till the Lord sees fit to call us to
stand before his face.
And we're mighty glad to tell you,
sir, we have no desire to roam,
For we think we know just what it
means to sell the old farm home.

Maxwell's Talisman.

"THE HOLY CITY."

THIRTY men, red-eyed and disheveled, lined up before a judge of the San Francisco police court. It was the regular morning company of "drunk and disorderlies." Some were old and hardened; others held their heads in shame. Just as the momentary disorder attending the bringing in of the prisoners quieted down, a strange thing happened. A strong clear voice from below began singing:

Last night as I lay sleeping.

Last night! It had been for them as a nightmare or drunken stupor. The song was such a contrast to the horrible fact that none failed of a sudden shock at the thought the song suggested.

I stood in old Jerusalem,
Beside the temple there,

the song went on. The judge had paused. He made a quiet inquiry. A former member of a famous opera company, known all over the country, was waiting trial for forgery. It was he who was singing in his cell.

Meantime, the song went on and every man in the line showed emotion. One or two dropped on their knees; one boy at the end of the line, after a desperate effort at self control, leaned against the wall, buried his face in his folded arms and sobbed.

"Oh, mother, mother!"

The sobs, cutting to the very heart of the men who heard, and the song still welling its way through the court room, blended in the hush.

At length, one man protested.

"Judge," he said, "have we got to submit to this? We're here to take our punishment, but this—" he began to sob. It was impossible to proceed with the business of the court, yet the judge gave no order to stop the song. The police sergeant, after an effort to keep the men in line, stepped back and waited with the rest. The song moved on to the climax:

Jerusalem, Jerusalem! Sing for the
night is o'er!
Hosanna in the highest, hosanna
for evermore!

In an ecstacy of melody the last words rang out, and then there was silence.

The judge looked into the faces of the men before him. There was not one who was not touched by the song, not one in whom some better impulse was not stirred. He did not call the cases singly—a kind word of advice, and he dismissed them all. No man was fined or sentenced to the workhouse that morning. The song had done more good than punishment could possibly have accomplished.—Youth's Companion.

THE LOVE SONG.

(It is said that the men of today are far less passionate in their love making than their ancestors.)

I love you, or at least I think
That very possibly I do;
In common honesty I shrink
From statements not precisely true,
But still it's safe to say I'm pretty
fond of you.

I cannot swear a mighty oath
To worship blindly till I die,
In fact I should be rather loath
To form so very rash a tie,
Unless I knew a most substantial
reason why.

I shall not, with a valiant air,
Pour out my life-blood for your
good,
Nor even boastfully declare,
That if I had the chance I would,
Because, to tell the truth, I hardly
think I should.

No knightly deeds have I to do,
And no impassioned words to say;
Still, I should like to marry you,
If you will tell me that I may,
And also kindly name the most convenient day.

I can't explain the thing, you know
(They used to tell us Love was
blind),
But since it hapens to be so
Forgive my weakness, and be kind,
Or, if you're not that way disposed —
well, never mind!

—Punch.

"If thou would gather words that shall
avail,
Learning a wisdom worthy to
express,
Leave for a while thy chat and empty
talk
Study the golden speech of silentness."
If thou hast yesterday thy duty done,
And thereby cleared firm footing for
today,
Whatever clouds may dark tomorrow's
sun,
Thou shalt not miss thy solitary
way."

—Goethe.

Pioneer Rubber Sanded ROOFING

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

FIG RECIPES.

The recipes for the fig preserves which were given last week call for more methods of handling this delicious fruit.

Canned Figs.

To 3 quarts boiling water add 2 heaping tablespoons soda; now dip your figs in the water for one minute and skim them out; then wash them thoroughly in two or three waters, or until there is no color left in the water. To 10 pounds of figs allow 8 pounds of sugar; add just enough water to dissolve the sugar; when boiling hot, drop in the figs, having first selected them with care so as to avoid any that are broken or overripe; let them simmer slowly two hours; now remove the figs and boil down the sirup until quite thick; replace the figs; bring all to a boiling heat, after which they are ready for canning after the usual method. A few slices of lemon with its juice will improve the flavor.

White-fig Marmalade.

A delicious marmalade is made from white figs. Take perfectly ripe and fresh figs, peel off the thin, soft skin, and to every 2 pounds of figs use 1½ pounds of sugar and the grated peel of a large orange or lemon; cut up the figs and mash them with sugar, adding the grated yellow rind and juice of the orange or lemon; boil all together until the whole is reduced to a thick, clear, smooth mass, stirring frequently from the bottom. When done, put into jars while hot and cover closely.

Those who like less sugar can use one-half pound of sugar to a pound of fruit, and it will keep perfectly, provided it can be boiled very clear and smooth.

Fig Marmalade.

Use only fully ripe figs. When they are considerably wilted they are cut. Cut in halves and scrape out the inside pulp; mash and strain through a very coarse sieve. Put into a glazed dish and place the latter in boiling water. Boil constantly for one-half hour and then preserve in sealed glass jars, like canned fruit. This marmalade is very fine; can be eaten with meat or alone with cream. It is a fine relish if made from good, sweet figs.

Fig Jam.

Boil sweet dried figs with some sirup until the juice is thick and sirupy, then run figs, sirup and all, through some kind of a mill that will grind it into a paste. A small sausage grinder is best, one that grinds fine. This paste is fine for use wherever a jam can be used, and can be made more easily than any jam or jelly.

Pickled Figs.

To 10 pounds of figs take 4 pounds brown sugar, 1 quart strong vinegar, 1 large cup of whole spices of the following kinds: cloves, cinnamon, allspice and cassia buds. Boil vinegar, sugar and spices first and when sugar is well dissolved, add the figs and boil until tender. The figs should have been picked before being shriveled. Put all in jars; pour out the liquid for three mornings, and let come to a boil and return to the figs; then close the jars.

Spiced Figs.

Peel ripe white figs, and to 10 pounds of the figs add 5 pounds of brown sugar, 1 quart of vinegar, 1 ounce of cinnamon, one half-ounce allspice, one-half ounce cloves, the spices to be tied in bags and boiled with the sugar and vinegar. When the vinegar and spices have come to a boil add the figs, a few at a time, to prevent mashing, and boil until they look clear. When all are done put into jars and pour the vinegar over them hot.

Candied Figs.

Are made only from young green figs not yet fully ripe. Place in glass jars, pour on salt water, and steam until soft. Pour off the salt water and pour over sirup made of one cup of sugar to three of water. After a day, take out, place on wire screens, and allow to drip for one or two days in a warm place. Place again in jars or earthenware; cover with sirup made of one cup of sugar to one-half cup of water. In this sirup the figs are allowed to remain as long as possible, or until required. Take out, drip, and roll in confectioners' powdered white sugar in a pan made lukewarm. When the figs have absorbed all the sugar they can they are taken out and packed in large boxes with powdered sugar. The preserved fruit is afterward repacked in small boxes for the market.

Crystallized Figs.

The figs must be picked when fully ripe, but before they are shriveled. Take figs of as even a size as possible in order to save assorting afterwards. Simmer in a kettle for twenty to thirty minutes but do not allow to boil. When ready the figs will have become clear and semi-transparent Drain off the water. Prepare a strong sirup of best white sugar and drop the figs in. Keep this in a cool place. In from 24 to 36 hours the figs will have absorbed most of the sugar and the sirup become very weak. Draw off the sirup, add more white sugar, and thus make the sirup stronger. Simmer, but do not boil. Drop the figs in and test again in 24 hours. If the sirup is weak renew the process. When the sirup retains its strength, the process is discontinued. Prepare a very strong sirup of the best white sugar; simmer, but do not boil. Previous to this the figs are dried in the sun, or in drier, until they slightly ring when dropped on a stone floor. The figs should, however, not be so dry that they cannot readily be indented when pressed between the fingers. Now immerse these dried figs for a few seconds in the strong, hot sirup, then drain off, and place on wire trays in a hot air drier or in the hot sun, if on a warm day. The sirup dries quickly and leaves the figs glaced. If crystallized figs are wanted, the figs are slowly dried in the shade, in which case the sirup crystallizes instead of producing a glace.

HOMELY HINTS.

The best contrivance to keep the shirtwaist in place is a piece of elastic about ½ the size of the waist with a hook and eye on either end. This fits snug and will keep the waist in place

A piece of muslin or cheesecloth sewed over the end of a quilt will protect the quilt and keep it clean. The cheesecloth can be taken off and washed many times before the balance of the quilt needs washing.

When washing painted woodwork or floors, use 1 teacup kerosene in a pail of warm water (no soap) and you will have the cleanest floor or painted work in the village. It is also excellent for hardwood floors. The kerosene gives the windows, floors, doors and window casings a beautiful gloss.

If your glass jars won't open, set them top downward in an inch or two of hot water.

Mayer

"SPECIAL MERIT" SEAMLESS SCHOOL SHOES

SCHOOL SHOES without seams—think of it—*seamless school shoes!* They are strong and sturdy, have seamless uppers, tough soles and double leather toes. By far the most durable and lasting shoes obtainable.

"Special Merit" Seamless School Shoes *"wear like iron."* They wear just twice as long as ordinary shoes with seams.

Made in all styles and sizes, for every day and Sunday wear—for boys and girls. Your dealer will supply you; if not, write to us. Look for the Mayer Trade Mark on the sole.

FREE—If you will send us the name of a dealer who *does not* handle Special Merit School Shoes, we will send you free, postpaid, a beautiful picture of George or Martha Washington, size 15x20. State which picture you want.

We also make Leading Lady Shoes, Honorbilt Shoes, Martha Washington Comfort Shoes and Yerma Cushion Shoes.

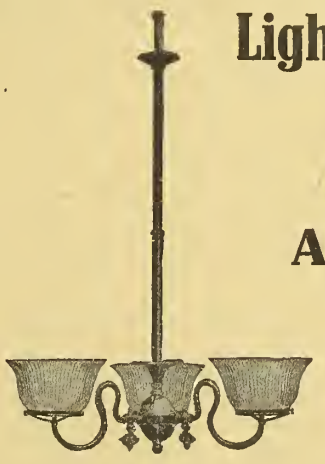
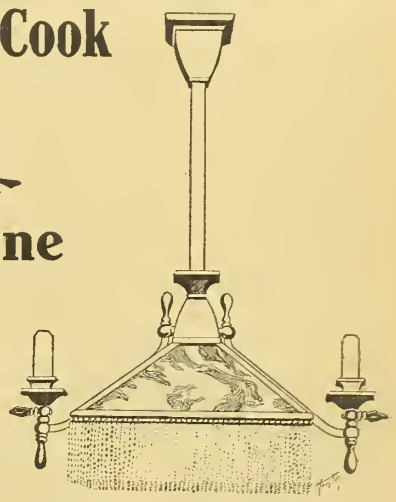
Light and Cook
BY
COLT TRADE MARK
Acetylene



PARLOR



DINING-ROOM

We have previously illustrated what a simple matter it is to install a Colt Acetylene Plant in your house. This week we wish to illustrate the improvement to one's property attractive and inexpensive chandeliers make in appearance and convenience. To effect economy and get better light, besides saving disagreeable labor, is an opportunity to be grasped.

The modernizing of a place with piping and fixtures is quite different with Colt Acetylene than other illuminants, for not only does the purchaser secure a great improvement to the property, but with the generator has an investment through the economy of the light itself and through its freedom from smoke, soot and grime.

Favor us with an inquiry concerning Colt Acetylene. We shall take pleasure in furnishing you with complete and instructive printed matter regarding piping, fixtures, stoves, burners of this wonderful lighting system.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Hay.

Somers & Co. say:

Hay arrivals continue to decrease on this market, the total for the week ending today amounting to 2370 ton in comparison with 2590 last week and 3670 the week preceding. Because of this diminution and the continued dry weather, prices have made a material advance. Should present conditions continue we may look for a steady improvement in prices right along. The advance is more marked with the choicer grades of hay, although practically all grades excepting perhaps stock hay and alfalfa, are selling for higher prices.

The outlook is unchanged in every way for although the demand is below the average, yet stocks are not overplentiful so that the situation is a peculiarly sensitive one. Should the rains hold off for a considerable period, thereby delaying the advent of green feed, the consumption of hay will be materially increased, which will of course tend to still further advance prices. The matter of economy is especially noticeable this season for feeders on all sides are reducing their requirements to a minimum. Not until trade in general is fully restored to a normal basis will we experience a resumption of our regular hay trade. For this we may have to wait for another season.

Citrus Market

LOS ANGELES, Oct. 14, 1908

The orange market is closing in fine condition. Valencias are commanding good prices and will probably all be shipped this week. There are not 25 cars left in the state.

Lemons are selling well. No foreigns, or but few are coming in and good prices are prevailing.

Shipments.

Shipments of citrus fruits to date since Nov. 1, 1907 aggregate 29,169 cars of which 4724 were lemons. To same date last year 27,372 of which 3398 were lemons.

NEW YORK, Oct. 13.—Five cars of Valencias and one mixed car of citrus fruit sold. The market is very strong. Weather clear, cool and favorable.

KILL THE ANTS.

While in this office recently Prof. R. S. Woglum, in charge of the field investigations of fumigation in California, referred to an experiment which he and Mr. Wm. Wood had tried in ridding a place of ants, which was so successful that we think it well worth quoting for the benefit of Cultivator subscribers. A daily paper referring to the matter has spoken of it as Prof. Woglum's success with the Argentine ant. He assures us, however, that he knows nothing whatever of the Argentine ant but the life habit of that ant is practically the same as the native ants on which his experiment was so successful.

The ant was the ordinary small red ant and infested the place where the office work of the investigation force was all done and was such a pest that something must be done. Prof. Woglum's work with the fumigation being largely with cyanide of potassium as the active agent he first turned to that to discourage the pest of ants. Working with Mr. Wood, who is county inspector for that district, they made a weak solution of the cyanide in water and sprinkled over the ground where there were myriads of the little pests. The rapidity with which they curled up and died was very satisfactory. They then took up some systematic investigations and experimented by pouring some of the solution in the holes occupied by the ants In some cases these holes never showed any life thereafter. In others a little weak effort on the part of those which were left was discouraged by a second application which almost invariably resulted in the death of the whole bunch.

The solution first tried was half an ounce of cyanide to a gallon of water. Later he found rather better results by increasing the strength to one ounce to one gallon of water. At the price at which cyanide may be had in quantities this makes the cost of the solution less than two cents per gallon. This is so exceedingly cheap that it should be tried by anyone who is troubled by the ant pest and certainly is well worth the trial on the Argentine ant which is causing so much apprehension in several sections of the state. It seems to be the fumes of the cyanide which kills, so that a light sprinkling is all that is necessary.

CONTROL THE FLOODS.

The good that will result through the control of the flood waters of the great Central California drainage basin can scarcely be appreciated by the average citizen who does not give the subject careful consideration. The control of the flood waters of the Sacramento and San Joaquin means, first, the reclamation of the large areas of flooded lands that at the present time are subjected to frequent inundations, creating great loss of crop, and destruction of dikes constructed to protect these crops on the low lying lands.

The construction of ample reservoir capacity to hold back the flood waters, and thus control the flood wave during the rainy season would be justified by the benefit that will accrue because of the freeing of low lands from the danger of floods alone; but the storage of flood waters will admit of threefold use—will make available the excessive moisture of winter for the irrigation of the semi-arid lands of the Sacramento and San Joaquin valleys during the dry season of the summer months, and help to maintain the navigability of the streams. Storage reservoirs on the Pit river and on minor tributaries of the Sacramento will provide capacity of impounding flood waters ample for the irrigation of the uplands of the valley. The storage of flood waters will overcome much of the danger from disastrous floods in the low lands; will make available the waste floods of winter for irrigation in the dry months of summer; and with a reasonable amount of work expended will make the Sacramento river available as a permanent artery of commerce.—The Great West.

IMPROVE THE RIVERS.

In response to an invitation extended by the River Improvement and Drainage Association of California, Brigadier-General William M. Marshall, the recently appointed chief of engineers, U. S. Army, has written to the association expressing the hope that he may be able, as invited by it, to visit California in the near future and have an opportunity to personally inspect California's harbors and waterways. The association feels that such a trip would greatly impress the new head of the engineer corps with the necessity for inaugurating a broad and comprehensive scheme of improvement work by the Federal government.

Some years ago, under the auspices of the association the then Secretary of War Taft was taken up the rivers on a trip of investigation, and in January last a committee from the Board of Engineers for Rivers and Harbors made a thorough inspection of the rivers and harbors of the state, coming to California at the suggestion and invitation of the river association. The result of their trip was the recommendation to the chief of engineers for comprehensive survey of the rivers. The work is now being done.

The interest evinced in California's welfare and the state's claims for federal attention by the new administration in the engineer corps gives assurance that a liberal policy for improvement in the state will be continued.

FIRST AT NATIONAL CONGRESS.

The National Wood Pipe Co. has been awarded first place for its display of wood pipe at the National Irrigation Congress recently closed at Albuquerque. This pipe is winning its way more and more all over the country and the award is only official recognition of the worth recognized by patrons who have used the pipe.

FLOW OF THE AMERICAN NILE.

A comparison of the flow of the Nile and the Colorado River of the West, which has sometimes been termed the American Nile, is given in Water-Supply Paper 211, just published by the Geological Survey. The maximum flow of the Colorado is about 110,000 second-feet; that of the Nile is about 353,000 second-feet; while the minimum flow of the Colorado is about 2500 second-feet and that of the Nile about 14,500 second-feet.

Like the Nile the Colorado is subject to an annual rise that comes at the time when it is most needed for irrigation, but as the stream is far below the level of most of the irrigable lands, its waters are available for use on a comparatively small area, though two pumping plants at Yuma and several others on the river above that place lift water for irrigation.

CONSUMPTION PREVENTIVE.

Fresh air is the doctor.

Don't live, study or sleep in rooms which are not full of fresh air.

Don't live in dusty air. Mop up dust with a damp cloth. Never sweep your rooms with a dry broom.

Don't eat with soiled hands. Wash them always before you go to table.

Don't keep soiled handkerchiefs in your pocket.

Seek sunlight.

Day and night, winter and summer, keep open the windows where you sleep.

Sleeping alone is well for the afflicted as well as for the well. Frequent bathing is highly advisable. To avoid indiscriminate expectoration is a duty

Plain food and plenty of it is the bill of fare for persons consumptively inclined.

Most of those who die from tuberculosis have neglected most of these rules of avoidance.

Consumption can be cured, in all but the advanced stages, by careful observance of sanitation. Fresh air, sunlight and food are its medicines.

Thou must be true to thyself
If thou the truth wouldst teach;
Thy soul must overflow, if thou
Another's soul wouldst reach!
It needs the overflow of heart
To give the lips full speech.
Think truly, and thy thoughts
Shall the world's famine feed;
Speak truly, and each word of thine
Shall be a fruitful seed;
Live truly, and thy life shall be
A great and noble creed.

—Horatio Bonar.

If a man could have half his wishes he would double his trouble.—Frank lin.

Celery Growing in California

An Address by H. S. Hazeltine, an Orange County Grower, Before the Farmers' Institute Recently Held at Wintersburg

THE celery industry of Orange county, we have no doubt, enjoyed the greatest period of prosperity without a reverse of any one of California's products. For twelve years the crop grew with vigor, possessing all the necessary qualities for shipping and market. The farmers thought the celery was immune from all pests and disease, and why not, in such a favored place. The soil was ideal for celery, and so rich that it would never need any fertilizer other than a crop of clover, rape or vetch; artesian water so plentiful that the crop would never want for moisture during the hot summer months or dry freezing winters.

The climate was all that could be desired, breezes from the Pacific ocean tempered and moistened the atmosphere, also brought in frequent fogs, all of which was conducive to celery culture. Desert winds would visit the district occasionally in winter, just often enough to kill all fungous growth that might be taking root. In fact, a more natural and ideal spot for celery culture, from a grower's standpoint, could not be found.

The Blight Appears.

But during the winter of 1906-7 the celery district, for some cause, (many believe the filling of the Salton Basin responsible) failed to get any desert winds, and during the latter part of January Orange county was visited with a very warm rain followed by an exceptionally hot and cloudy spell of weather. It was during this period that the blight first made its appearance in California. The celery was over-ripe at the time, on account of car shortage during the fore part of the season, and with poor transportation service the remainder of the season, it caused the growers a tremendous loss.

This, however, did not discourage the farmers, as the same acreage was planted the following season, 1907-8, with no preparation whatever for protecting the crop from disease. The crop grew with unusual vigor until the middle of September when some blight made its appearance and retarded the growth to considerable extent. This was considered of little consequence at the time, but early in October a light rain fell and, like the rain in January of the previous season, was followed by a sultry spell with occasional showers and, as a natural consequence, the blight spread rapidly to all parts of the fields, many crops were badly damaged, and shipments would have resulted very disastrously had not the utmost precaution been exercised in preparing the celery for shipment, and excellent service been rendered by the railroad company, in well equipped cars, ample icing facilities, quick time and prompt delivery.

Experience has taught us much along the above lines, and the result was a fair price received by the growers for shipments in November. The weather was more favorable for celery and less favorable for blight growth during December and January, and the celery outgrew the disease to a certain extent, making shipments fairly satisfactory. However, the whole crop was affected with a fungous growth and only waiting for favorable weather to develop it, and as warm rainy weather is sure to come in early February the farmers were not much surprised to find their crops totally destroyed by the middle of that month.

Salvation in Spraying.

Spraying with Bordeaux mixture, as an experiment, had been carried on during the winter months under the direction of Prof. Ralph E. Smith of Whittier, and the result was wonderful to note. Notwithstanding the work was begun after the celery was badly affected, the crop was preserved and very little blight was noticeable at time of shipment. It might be mentioned that the celery shipped well and brought high prices in the market on inspection. This experiment furnished the only ray of hope for the celery growers, and acting under the advice of Prof. Smith, the farmers were encouraged to plant another crop, although very small as compared with former years. Prof. J. H. Ramsey of Whittier was placed in charge of the crop at the beginning, and has directed the work of caring for the celery from a scientific standpoint while the Celery Growers' Association and many individuals have co-operated with him in carrying out the work in detail. Prof. Ramsey has visited the district frequently, inspecting the work and noting results. He is ably assisted by Mr. W. E. Gerhart, an employee of the Celery Growers' Association, who devotes his entire time to spray work, going from farm to farm instructing the growers how to mix and apply the spray, and at the proper time.

Remarkable Results Obtained.

It is with pride that we report the remarkable results achieved by this work. Time and again the blight has taken hold of crops which have been neglected to some extent by indifferent farmers, and by applying the spray vigorously the celery has been brought out in perfect condition. The Bordeaux mixture seems to act as a tonic for the plants and the oftener applied the faster the crop seems to grow, and where the celery is of sufficient size to determine the quality, we notice the exceptionally heavy foliage about the plant, something we have not seen since early days of the industry.

Although the crop conditions, as stated above, are most favorable at the present time, we do not know what is before us, but venture to say that if the farmers carry out the work according to the instructions given them by Mr. Gerhart, we will harvest a crop that will be a credit to all concerned.

* * *

CELERY DISTRICTS.

Celery is now being grown in nearly every state in the union for local consumption; however, there are only a few states which have attained any reputation as celery producers from a commercial standpoint, and these states have come to the front almost as rapidly and prominently as has California.

Florida is our greatest competitor, shipping celery into the market at a time when we are enjoying our best trade, February and March, spoiling all opportunities for high prices and frequently compelling us to sell at low prices. Florida has some advantages and many drawbacks. Let us compare her with California.

Florida vs. California.

Florida's climate is changeable, and unfavorable for celery many times during a season; Southern California climate as a rule is ideal.

Florida soil is light and sandy, containing very little of food necessary for plant life, especially celery. Fertilizer must necessarily be used and we are told it is necessary to apply it to the value of $250 per acre to insure a good crop of celery. California soil is rich, and with a green crop, such as clover or rape to plow under each year, produces satisfactorily without any fertilizer.

Help, we understand, can be secured a little cheaper in Florida than in California.

As to yield, Florida growers run their rows much closer than California growers and plant the celery double in the rows, bleaching with boards. By planting in this manner the yield is more than three times that of California per acre.

Freight rates are considerably less to eastern cities than from California, but equipment and service is much inferior to that of ours.

When it comes to quality, we will certainly not admit that our celery is inferior to theirs, as we are told by dealers that they prefer our stock to any other, and Florida growers tell us that they are told the same story by the dealers, and we presume they are, but we believe dealers prefer to handle our product in preference to any other on account of its keeping qualities, thereby insuring them a profit on the purchase.

Now then, we have climate, soil, transportation advantage and quality of product, as against Florida's big yield and low freight rate, which would be much in her favor should we not consider the enormous expense of fertilizing and the amount of money invested in lumber for bleaching the crop, which fully offsets her advantages, and places California in a position to compete with her in the eastern market, so long as our crop is in its normal condition. Florida's crop will amount to about 1500 cars the coming season.

Michigan Competition.

Michigan is our second largest competitor and ships into the market during the latter part of the summer and fall, holding more or less of her product, according to the season, until early in January.

The quality of the Michigan celery during November and December is much inferior to California's product and sells at about one-third the price, and is mostly used by restaurant and hotel men for soups and salads, or by cheap restaurants in some instances as a relish; therefore, you will note that while the Michigan crop supplies the demand for small, cheap celery, it interferes very little with large, fancy California stock.

New York State.

Our third largest competitor is the Empire State, which produces several hundred carloads of celery each year; and the quality is far superior to that of the Florida or Michigan product, and fully equals California's in size, flavor and hardness; but the territory is limited and the crop, always in good demand, is cleaned up early in December, or before the bulk of California celery is ready for market.

Middle West Product.

Colorado, Nebraska, Illinois, Ohio and Missouri must be recognized as factors in the celery deal, each state supplying its local cities with celery until about Christmas time, excepting Colorado, which depends upon local celery until nearly February. Colorado celery has an excellent flavor and possesses good keeping qualities; in fact, compares favorably with that of California and New York State.

Northern California.

Northern California will always produce more or less celery for eastern shipment, according to weather conditions. There is nothing to prevent that locality from having plenty of celery for early and late market, but during cold winters it

LEMON IMPORTERS.

Lemon importers in New York are by the ears over the action of the health board of that city, insisting on full sized boxes and that the importer cease handling "short" boxes The president of the association deemed the demand wise and proper and issued a circular commending it. This stirred up the nest and resignations from directors followed.

Regarding the situation the Packer says:

Mr. Zorn said that he did not intend to resign as president of the New York Fruit Exchange unless the majority of the members asked him to. He said that if that should come to pass he would continue then as an ordinary member and still stand pat on his letter.

It seems as though before the importers sent their resignations they agreed to a proviso that in case Mr Zorn would resign as president they would withdraw their resignations.

There is some doubt in the minds of some of the dealers as to whether the health department which issued an ultimatum to receivers that the size of lemons and boxes must represent what they are branded has any jurisdiction in this case. Inspector Fuller of the health department thinks he has. However, some of the importers say that the lemons are sound and highly fit for human consumption If they were not the health department would have a say so, but they cannot see where the health department has anything to say about sound fruit being unlawfully sold.

It seems as though the State Agricultural Department should take a hand in this and settle the whole matter. It was only a few months ago that the agricultural department of the state dealt a body blow to the short apple barrel. It can do something to the short lemon boxes by demanding that the contents of the box and the box itself be branded properly. Strange to say, however, the matter has not been taken up with the Department of Agriculture.

MULCH DEEPLY.

Mulch is an important factor conserving moisture. Mulch as deeply as possible. The experiment of mulching and cultivating six inches deep and three inches deep was tried with two orchards during a very dry winter some years ago. A third orchard was allowed to go without mulch and without cultivation. The orchard that was given a deep mulch and cultivation produced fine fruit of an excellent quality. The orchard with the three inch mulch and cultivation produced a large crop of fruit but of slightly inferior quality, while the third orchard produced little fruit and that of poor quality. Great benefit, also, is received from fall plowing and some benefit, but slightly less, from summer fallowing. The processes are chiefly to retain moisture in the ground.—Dr. R H. Laughridge.

LOUISIANA ORANGE CROP.

A dispatch from New Orleans in a recent Packer says that the present outlook for the Louisiana orange crop indicates that the yield this year will be about 30 per cent larger than the last year's production is the opinion of local fruit and produce men who have recently made a study of the situation. This is so, it is stated, despite statements to the contrary made some weeks ago. It is stated that the crop, which has already begun to move slowly, will soon be moving in volume. Up to the present the stock received in the local market has been fair. It is improving, too, and before long it is expected New Orleans will be getting some of the best Louisiana oranges ever shipped into the local market. The prices today on the ordinary grades range from $1.50 to $3 per box.

THE VALUE OF MANURE.

An average cow, of 1000 pounds weight, fed as a dairy cow should be. will throw off thirteen dollars worth of nitrogen and potash a year in her urine, says Mr. Hoard in a recent editorial in the Dairyman. A horse will throw off eighteen dollars worth

Every farmer has observed in his pasture how green and luxuriantly the grass grows where the cows have deposited urine. He can see from this how much greater is its fertilizing value than manure.

Yet we have observed that not one dairy farmer in a hundred has made any real practical effort to save the urine of his cows and horses in their stabling. It is lost in three ways. Either the stable floor is not water tight, as it should be, and it leaks through into the soil below, or it is piled up in heaps in the barn-yard and is not hauled out every day on the land, or no absorbents are used to help hold the nitrogen and potash until the land can absorb them.

No real thinking, intelligent man. who knows anything of the value of the urine and how it is wasted, will handle his manure as the majority of the farmers do handle it. How many farmers who use plank floors ever calk them with tarred rope to make them water tight so the urine will not leak into the ground below? How many use land plaster or ground phosphate rock or both, every day in their stable gutters to absorb this great value till the land can use it? How many haul out their manure every day in winter, so that as much as possible of all these valuable elements may go to the soil and not elsewhere, as soon as possible?

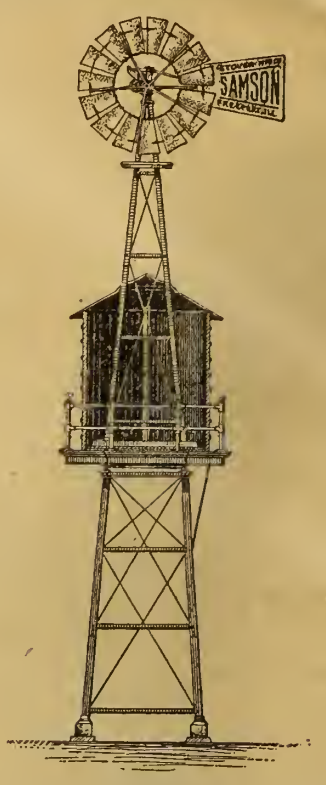
How many farmers sprinkle land plaster or phosphate rock in their summer accumulations of manure so that the nitrogen and other elements may not be lost by evaporation and leaching by rain? These are mighty pertinent questions. They reach down to the state of knowledge the farmer possesses; down to the practice he follows; down to the real situation and the enormous waste of manure that is going on.

GYPSUM vs. HARDPAN.

The problem of hardpan has been solved, it is said. V. Rambo has lands between Lerdo and Famossa on which for years he has been unsuccessfully trying to produce vines and trees. Owing to the hardpan lying close to the surface, no results were obtained. Someone told Mr. Rambo that someone else had read somewhere that if gypsum were spread over the surface of the ground the hardpan would dissolve. He tried it on a few acres and the scheme worked. He then scattered gypsum over 160 acres and now has a quarter section of land as good as can be found anywhere. The material contains the elements which, carried down to hardpan, causes that substance to disintegrate, much as gasoline "cuts" grease.—Bakersfield Californian.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Deciduous Fruit Culture

By J. W. Mills

FRUIT TREE TROUBLES.

There was little to worry the California fruit grower when the industry first became of commercial importance, except the railroads and commission merchants. When the Eastern markets were first opened to the California grower there was a general rush to plant varieties of fruit that brought good prices in the various markets, and as a result large quantities of nursery stock were imported from different countries to satisfy the demand.

Aspidiotus Perniciosus.

The Santa Clara valley, Santa Clara county, was the pioneer section in growing deciduous fruits in commercial quantities, and it was there that aspidiotus perniciosus (San Jose) scale was introduced, or at least discovered in California. Much to the chagrin of the city of San Jose, its name is the symbol of dread and disgust to every grower of deciduous fruits from the Pacific to the Atlantic. The thousands of dollars this insect has cost the fruit growers will never be counted.

This was the most destructive and expensive fruit pest that had ever confronted the grower, and all sorts of remedies were tried with little effect until the lime, salt and sulphur remedy was discovered. This grew out of a sheep dip solution which was thrown on some badly infected fruit trees after a sheep raiser had finished dipping his sheep for scab. The lime, salt and sulphur wash is entirely satisfactory for this scale. We have seen two sprayings clean perfectly a 200-acre orchard of large peach and prune trees.

There is a natural enemy that holds this scale in check to a certain degree, but it is still very destructive at times if left unchecked, and will eventually kill a tree. It sometimes gets on the fruit, especially pears and apples, in which case it must be sprayed with a wash that will kill the scale on the fruit without injury to it. The resin wash will do this, but it will not free the whole tree of the pest, as it is impossible to do this when the leaves are on the trees. The trees thrive better when sprayed with the lime, salt and sulphur wash and it is often used independent of the San Jose scale. A thorough winter spraying with this will cure many tree ills. It will kill a large percentage of red spiders on deciduous trees if applied in the spring just before the blossoms or leaves appear. It will not kill the eggs but will send off the sulphur fumes at close range and smother most of the young spiders as they emerge from the eggs. Spraying at the same period will also kill the peach worm and hold shot hole fungus in subjection.

Root Knot.

About 1888 deciduous fruit growers began to be alarmed over the appearance of root or common knot on the roots of their trees. It was at first supposed that it only attacked peach roots. This was because nearly all kinds of deciduous fruit trees, except almonds, were grown on peach root. It was soon found to infest all kinds of deciduous fruit tree roots and even those of rose bushes. The trouble soon became alarming and was one of the standing questions for discussion at all horticultural meetings This disease has caused more wholesale loss to the fruit growers in California than any other trouble affecting the health of trees, not excepting pear blight. As a single example, one fine orchard of 640 acres in the San Joaquin valley became so badly diseased that nearly all the trees could be broken off at the ground by the hand. These trees appeared to be perfectly healthy until they were four years old. The disease became general all over the coast and extending to the western states.

Old trees may become quite badly infected in the lower root system and continue to bear profitable crops, but to what extent the profits are reduced cannot be calculated, as the extent of the disease and its effect cannot be traced. The extent of the injury to the productiveness corresponds to the amount of diseased roots and the position of infection. If it were only the reduction in the amount of fruit produced it would not be such a loss, but the poorer quality of the product constitutes a heavy loss.

It was once supposed that peach pits from seedling trees were immune, but this is not true. Of all the diseases known to the California fruit grower this is the most troublesome. Trees absolutely healthy and with clean roots will make a magnificent growth for a year or two and in one season be rendered worthless. It comes like a thief in the night, but cannot be driven away. Eradication of the disease means in most cases the uprooting of the trees.

Curl Leaf.

Curl leaf of the peach was once a mysterious disease and was supposed to be due to wet winters. It is a fungous growth that thrives best during wet seasons, certain varieties being immune, such as Tuscan Cling, the Alexander type and some others, while most of the southern type are very susceptible.

The work of Prof. Newton C. Pierce in the Rivera orchard on the Feather River shows that it can be controlled by the use of Bordeaux mixture. Every peach grower should procure a copy of this valuable book (Peach Curl, Its Nature and Treatment,) which can be had for a few cents by applying to the Superintendent of Public Documents, Washington, D. C.

This report shows the wonderful increase in the productiveness of peach trees when curl leaf has been treated with Bordeaux mixture.

Prune Rust.

Another very destructive fungous disease is prune rust. It appears on the under side of the leaves in small brown spots and finally causes the leaves to drop. In two months after it attacks a tree there will not be a leaf left. It attacks the prunes, most varieties of plums and almond trees. Native American plums, so far as we know, are not subject to it. A dozen or more varieties growing at the Pomona Experiment Station were not affected, while European varieties all around them were badly affected. Wayland was particularly vigorous and green under these conditions. Prof. Pierce considers it a valuable variety to use as a cross in plant breeding to impart hardiness and resistance.

Continued on Page 403.

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Vote for Senate Amendment Number One

Written for the Cultivator by John Tuohy of Tulare. Mr. Tuohy is chairman of the State Grange Committee on taxation which at its recent meeting at Sacramento unanimously endorsed the Senate Constitutional Amendment No. 1 and urges all farmers to vote for it.

WHEN California was organized as a state and its constitution studied, formed and adopted, it was provided in it that its government should be maintained by a tax on property, and for that purpose all property, real and personal, should, according to its cash value, bear an equal pro rata of the tax. Fifty-eight years of practical trial of this system of revenue has proved its unworthiness, has proved that only a small portion of one class of property, for taxable purposes, can be ascertained, and in many cases, when ascertained, its cash value is not readily determined. The full amount of personal property can never be fully ascertained. No system of penalty incurring oaths has ever done it or will ever do it. It can be ascertained only by the truthful admission of the honest citizen, willing and anxious to bear, as every citizen should be, his equitable pro rata of governmental expense. Students of government and expert investigators of our revenue laws have for years denounced our present system as unjust and its attempted enforcement a school of perjury and a mockery.

The State Grange has given years to the study of a better system of taxation for state and county purposes. This study has led it to similar conclusions to those arrived at by the California Commission on Revenue and Taxation. It believes the revenue system recommended by the Commission and provided for by the amendment, is the very best our social and industrial conditions will permit. The Commission is composed of able, impartial, careful men. They have given years to the study of the subject. Its conclusions and the revenue systems provided by it should have our approval. It has the approval of the State Grange, Patrons of Husbandry of California.

That there would be some opposition to any revenue system the Commission or the Legislature or both could devise, was anticipated. That opposition has materialized. It does not propose a better system of its own. It does not deny the present revenue system is criminally discriminative between classes of tax-payers. The defect is in the system. The opposition desires the continuance of that discrimination and defect, and for that purpose the continuance of the present revenue system. It is claimed the "cow counties" only will be benefited by it, the large cities not. That the revenue provided for the state will be insufficient. That the state must have additional revenue and this must be provided for by a general property tax. That the railroads and public utility corporations will have a fixed rate of tax and are exempt from special taxes; that the railroads will corrupt and buy the State Board of Equalization and manipulate assessments and falsify their books.

Supposing the "cow counties" will be benefited by the new revenue system. Have they not for fifty-eight years borne a tax of 10 per cent. on their gross incomes where the manufacturers have paid a tax of 2 per cent. If their property is relieved of a state tax is it not also deprived of a pro rata of railroad tax? Will not their lands be taxed for four-fifths of the revenue for county purposes still? Will not their personal property be more searchingly and scrutinizingly ascertained than that of the cities? The State Grange passed resolutions protesting against this discrimination in favor of cities. Let the personal property of the cities be assessed by the same sown, itemized schedules made obligatory on the farmer and see how their assessment rolls will increase. The kickers in the cities assert they will, under the new system, have more taxes to pay, and it is only in a few large cities like Los Angeles and San Francisco that there are kickers, but they give no figures. The Commission on Revenue and Taxation has figured out what the difference will be and the figures are to the cities' credit; and this is so, but were it not so justice requires that they should contribute a greater pro rata of tax than they have done, and farming property less, and it should be paid from a moral sense of equity in taxation and of duty to the State as good citizens. The Commission on Revenue and Taxation, after a two years' study and investigation, have decided that a tax of 4 per cent on the gross income of railroads will be equivalent to a tax of 1 per cent on the true cash value of its property at its or their true cash value. The report of the Commission also shows that the revenue provided for the state by the system it has formulated will be ample and that if it is not, it points to other means by which the deficiency can be made up, and will be made up without recourse to a general property tax for state purposes. It is charged that the railroads will corrupt and debauch the State Board of Equalization and falsify their own books to evade the payment of a just pro rata of tax. This is too reprehensible a charge for consideration and it is only an assertion. The state will elect honest men and those men will do their duty, and the railroads will not falsify their books that they submit for examination to honest and fair-minded state officials. In a fair consideration of the subject such charges are not admissable. No court of equity would tolerate them.

The payment of a fixed amount of taxes by the railroads and other incorporations as proposed by Senate Constitutional Amendment No. 1 will to a great extent eliminate them from the power of the grafter and give better and more honest officials. Temptation will be removed from them. Adopt the amendment and try it.

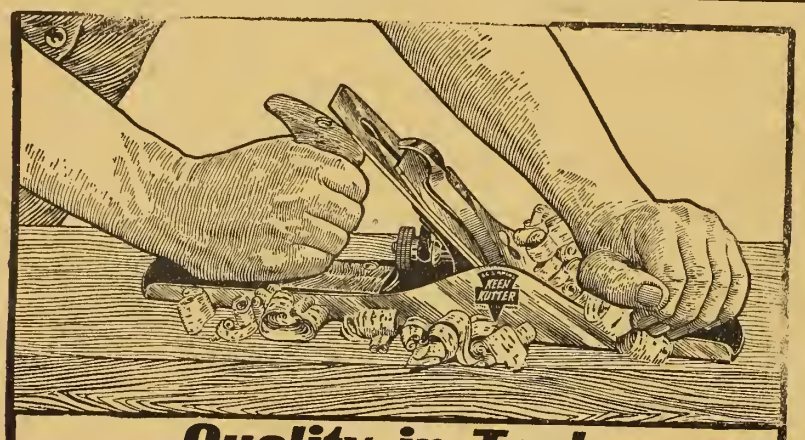
If the large cities, for public utility purposes, incur a large bonded indebtedness requiring 5 to 20 cents additional on every $100 to meet it, I would ask would they then be paying more than one per cent on the true value of their property? And will the increased income from the increased business of the corporations be a full equivalent to it?

The Patrons of Husbandry do not ask for a system of taxation that will have no item or incident of injustice, that is not imaginable, but they do ask that the present system of taxation be abolished because its practical enforcement unjustly discriminates against them and they do ask the adoption of Constitutional Amendment No. 1 because it is nearer equitable in its requirements. They will even then pay a higher pro rata of state and county taxes than will the city tax-payer.—John Tuohy.

MCDONALD PEACH.

A late freestone peach with good flavor and good keeping and carrying quality will add to the wealth of the peach growers of California. Such a peach has been grown and tried under most all conditions and in many soils. It has proved an excellent bearer year in and year out. It is several years since the good qualities of this peach were first discovered in a seedling tree grown by Mr. McDonald in the San Bernardino mountains. Samples were brought to the office of the Cultivator when G. H. A. Goodwin was its editor and he named it the McDonald Peach. Year after year its testing under different conditions has been watched, several of the trees being grown in Gardena and producing exceptionally fine fruit. This year Mr. A. Yarnell, 4524 Central Avenue, Los Angeles, has trees for sale and in quantity so that they may be supplied to planters who may wish to test this exceptionally fine peach.

It was tested by Mr. J. W. Mills, then in charge of the Citrus Experiment Station at Riverside, and pronounced by him "an entirely new and distinct peach and in his opinion a very valuable addition to the peach industry." In size the peach is medium to large, sometimes weighing 14 ounces, and 11 inches in circumference. Fruit is fully ripe by the middle of October, is a rich rosy red on the outside with flesh a deep yellow. Circulars may be had by addressing C. A. McDonald, Box 662, Colton, or may be had at the nurseries of Mr. Yarnell at above address.



Quality in Tools

Tools for the workshop, farm or home must be tools of quality. A plane, for instance, to smooth a board properly, must have a keen blade, carefully adjusted—its surface must be true and it must fit the hand.

KEEN KUTTER
Tools and Cutlery

Agricultural Education in California

Address at the State Farmers' Institute, University Farm, October 8, 1908, by E. J. Wickson, Dean of the College of Agriculture of the University of California.

CALIFORNIA is advancing so fast in provisions for agricultural education that it is timely to assemble the various undertakings so that they can be covered by a comprehensive glance and possibly some ideas formed of their mutual relations and obligations. Such a view will necessarily be superficial and only suggestive of some of the truths deep in the needs of mankind and in the educational philosophy which helps us to know how to minister to them wisely and effectively. It must be insisted upon, however, that provisions for agricultural education which the people are now demanding in all but strictly urban schools, are fully warranted:

First, because they aim directly at a higher life—in thoughtful and effective individual labor, in family health, comfort and content, and in better citizenship.

Second, because they are the entrance to a higher and truer educational effort—which shall develop accurate perception and correct conception from the study of immediate environment; proceeding thence to broader conceptions of mankind and of the universe. In this respect the new ideals and purposes which are accomplishing a revolution in our methods and philosophy of education are vastly superior to the old, just as the scientific method of reasoning by drawing the truth from many careful observations is a safer and surer way than to jump at something supposed to be true and then bending all the resources of the mind to establish it. The changes in our educational ideals and methods are, in fact, due to direct application of the scientific methods of observation and reasoning to the common and universal affairs of life.

The Newer and Better Way.

There may possibly have been some excuse or possibly even a reason for the old conception of education as a thing which would give a man power and comfort in some possession of wisdom wholly apart from and beyond his life problem; something akin to the old monastic conception of education, but such a purpose in education is passing from view. Manifestly a man should rise to the contemplation of the lofty delights of learning through the elevation of his life and in the light of such elevation, and not by vain efforts to escape from life's burdens. Such an upward course demands imperatively that all men should be taught to live well and to labor efficiently—then let those rise who can. Fortunately the same elementary training which befits a man to his environment and helps him to improve that environment, gives him the fullest efficiency in vocational labor, if he limits his effort to this, and is also the best foundation to build his lofty castle of science and culture, if he choose to do that and has the mind for it. From a humanitarian point of view it is incalculably better that those who fail at such castle-building should fall back to a plane of vocational efficiency than, lacking such training, they should drop to social uselessness or dangerousness.

The proper purposes of education, then, are to enable men to live better, because they can work better. The immediate application of this principle to agricultural education can hardly be described better than they were by President Roosevelt in a recent letter in these words:

"The great rural interests are human interests, and good crops are of little value to the farmer unless they open the door to a good kind of life on the farm. It is especially important that whatever will serve to prepare country children for life on the farm, and whatever will brighten home life in the country and make it richer and more attractive for the mothers, wives and daughters of farmers, should be done promptly, thoroughly and gladly. . . . The farmers have hitherto had less than their full share of public attention along the lines of business and social life. There is too much belief among all our people that the prizes of life lie away from the farm. I am, therefore, anxious to bring before the people of the United States the question of securing better business and better living on the farm. . . . to make country life more gainful, more attractive and fuller of opportunities, pleasures and rewards for the men, women and children of the farms."

The same ends should, of course, be attained for all other faithful workers, and although much can be achieved for our present adult population by enlightened and effective organization for promotive and protective ends, the great hope for the workers of the future must lie in the improvement of the schools by the introduction of a just proportion of subjects which underlie and pertain to local industries and which, when properly taught, make both for mental discipline and for livelihood. This effort is receiving the earnest support of statesmen and educational philosophers, of parents and of teachers, and the children themselves show by their quickened interest and application that once again in the world's history little children can teach wise men wisdom.

The Attitude of California Teachers.

As the course of reforms in education, which I have thus tried to suggest, is now in progress in all civilized nations and may thus be truly characterized as a world movement, it is gratifying to know that California has full faith and active participation in it. Teachers in primary and grammar grades in all parts of the state are seeking suggestions as to forms of elementary science which can be taught rationally and endeavoring to master themselves the knowledge of fact and method of demonstration which will really help the children to know and understand what nature is doing around and beneath them. Nearly, if not quite, all of our five normal schools are supplied with good special instructors and outfits and are trying to teach the teachers how to do less with books and more with the nature, significance and relations of things which children naturally like to gather and work with and wonder what their uses are. Our high school trustees and teachers are eager to employ the uni-

Australian Eucalyptus Seed

Our Mr. R. S. Webb (a native Australian) has just returned from that country with seventeen varieties of Eucalyptus seed, comprising the varieties that have been tried in Australia, and each variety is the best for the particular purpose for which it is used, or for the particular soil and climatic conditions where they grow.

The following are some of the varieties of Eucalyptus trees preferred by the lumbermen and manufacturers of Australia:

1. Iron Bark (Panniculata)
2. Microcorys (Tallow Wood)
3. Black Butt (Pilularis)
4. Turpentine (Syncarpis)
5. Resinefera (Mahogany)
6. Tereticornis (Red Gum)
7. Saligna (Blue Gum)
8. Corynocalyx (Sugar Gum)
10. Spotted Gum (Maculata)
11. Jarrah (Marginata)
12. Sideroxylon (Iron Bark)

We will have trees of the above varieties for sale about February 1st.

THE COLLIE DOG.

Collies are one of the best breeds of dogs for the farm. They are useful to the shepherd and drover and possess an unusual amount of intelligence. Those who are fortunate enough to own good ones are particularly attached to them. The collie should be given good attention, but at the same time he should not be kept too fat. He needs exercise to keep him in good muscular condition. Twice a day he should be fed cooked food. He should be washed regularly when the weather will permit. When the weather will not permit of washing the coat should be dusted with tobacco dust powder.—Journal of Agriculture.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

AGRICULTURAL EDUCATION IN CALIFORNIA.

Continued from Pege 391,

versal interest in science to extend and diversify their studies so that they can hold more pupils to higher courses of instruction. In all these efforts which are commendable there is also what may be described as almost a thirst to render these new subjects practical, which means to command the further respect and interest of pupils by showing how all these fresh facts and new ideas are directly valuable and helpful in the work which people are doing in the fields, orchards and shops around them. When one becomes aware of how quick and eager the children are to connect their school life with the adult work which their parents and friends are doing, it becomes almost incomprehensible why for centuries educators have taken their subjects from almost everything under the sun but industry.

This effort to bring all the rural schools into close educational relation with their industrial environment is advancing in California about as rapidly as it can successfully. Such work cannot be mastered as easily as the old lines of book subjects; it is vastly harder for the teacher to keep just a little ahead of his class, which is unfortunately the measure of the ambition of too many teachers. Just as soon as you give a child his liberty among the things which surround him he is apt to drive his teacher up a tree at his first rush. Teachers must, therefore, be specially trained; they must at least know what they ought to be able to explain and what the wisest man in the world would not undertake to explain. Teachers are preparing themselves for this work; our State Teachers' Association is continually assisting them, and our State and County Superintendents and Teachers' Institutes are working earnestly in the same direction. The outlook is very gratifying and encouraging, but the ultimate attainment will take much time.

The California Polytechnic School.

But California is doing more than promoting this general introduction of vocational subjects into the rural common schools. The state is building up a system of special schools of the industrial class, by public appropriation and by personal bequest, which will have marked influence not only in the development of our industries but in the reformation of our whole school system. Reference in this connection may properly be restricted to institutions dealing with agricultural subjects. A flourishing agricultural high school, which is in some respects a pioneer in its class, is the California Polytechnic School at San Luis Obispo. It deals with mechanical subjects also, and is well equipped with instructors and shops for such subjects, but it holds distinctly a rural point of view and its main work is in agriculture and household arts with special instructors, buildings, tools, live stock and other facilities for practical work and demonstrations. Situated upon a farm of over 300 acres and destined to teach during the year which opens this month not less than 175 pupils gathered from different parts of the state, this California public school, liberally supported by the state, not only affords instruction connected directly with livelihood to the hundreds who have attended since its opening five years ago, but it stands as an exponent of the popular approval of an effort which makes industrial subjects a leading feature in a school of secondary or high school grade.

University Farm and Kearney Schools.

Another notable attainment in agricultural education in California is the purchase and equipment of the University Farm at Davis, in Yolo county, as a part of the instructional outfit of the College of Agriculture of the University of California. Under the law this institution will provide instruction of several grades, for all of which the outfit of buildings, live stock, implements and lands will be available. Here farming and farm manufactures will be conducted upon an actual and commercial basis so far as feasible in connection with instructional operations. The best equipped creamery in the state is now turning out about 250 pounds of butter daily, and a model dairy barn is now nearly completed, while numerous other buildings for various purposes are already constructed or in progress. All these facilities and the 780 acres of fine valley land upon which they are provided will be the collective outfit for a sries of short practical courses in all branches of agriculture which will afford youth and adults alike opportunity to become acquainted with the best California farming practices. Besides these courses for all who desire them, the University Farm will also have courses in farm life and work for the regular students of agriculture in the university and high school instruction in agriculture for boys who have finished the grammar school. The University Farm will then afford instruction in practical agriculture in all its branches to those of all ages, each according to his needs and desires, and it may be approached through the high school or the University, or without either. It is difficult to see how practical instruction, for which there is believed to be a great popular demand, could be made more available.

Another institution for agricultural and horticultural education in which it is hoped that the great San Joaquin Valley will take particular interest, will be opened in due time upon the Kearney estate near Fresno, which was bequeathed to the university by the late M. Theodore Kearney for such purposes. This property has not yet come into the possession of the University, but when it does so the work of planning and providing an agricultural school and experiment station especially adapted to the needs of this great valley, as the donor desired it to be, will begin.

Agriculture in the University.

In one way or another, all these gratifying advancements in agricultural education in California are connected with or proceeding from the College of Agriculture of the University of California. Teachers of elementary agriculture in the lower schools are largely University graduates or those who, having secured general training elsewhere, have sought special preparation in agriculture at the University. Upon the University will devolve the duty to largely increase its work in this line, cordially co-operating with the normal schools and with other universities to the end that those desiring to teach agriculture in California shall be able to teach California agriculture. In this effort the University departments

Live Stock and Dairy

By Mrs. Minna E. Sherman

TYPE IN COWS.

THE difference between the type of a dairy cow and a beef cow is marked in the pure bred animal, but the shade of difference between the best and the next below the standard, is not great. At the top it is small but like any other wedge it is a forcing open the block. The difference between common cows and well bred ones is very wide. The common cow is an animal that is neither beef or dairy stock. Yet, every day, people are telling of cows that are dual purpose animals. What are the common raisers of cows doing anyway? Merely raising cows to feed them and to receive scanty returns of milk. Yet, there are many cows of merit that have no pedigrees. Why not try to raise a few of these? A good sire and you will soon have good milk cows. At the present time things are dull and cows are shaded in prices. It is a good time for buyers to select a few head of well graded up cows to have milkers at once. Then head the herd with a good sire of the same breed and see what a few years will do for you in the way of raising the production of the herd.

Common Stock.

While for a long-time business there is much money in the pure bred stock, there is, also, a little money in the common cows. When a man is a fair judge of dairy stock he can do well in buying cows and bringing them into good condition, raising a calf perhaps from each one and then selling them as family cows. In other words, he can sell his knowledge of dairy quality to others.

The heifers of the best cows will be of half the blood of the registered sire and will bring the young animals into good form rapidly. There is nothing more desirable from a dairy point of view than a uniform herd of cows. Now, while we naturally think of pure bred cows as better than grades, and to be preferred, the quality of the cows must be held up by careful and discriminating breeding and feeding. There are pedigreed scrubs to be found all over the country. I have been at several fairs during the past two months and was pained to see some of the animals that wore the blue ribbons. The fact I hope to see come to the front in the judging of registered dairy cows is not giving any ribbons when the animals do not deserve it. I saw herds this year win at fairs that had I been judging I should have cut them out the class altogether. A cow that receives a blue ribbon should be typical of her breed. The dairy preference tests, of course would be an exception to this rule.

Blue Ribbon Cows.

I saw at one fair among the dairy stock of pure bred cattle, one heifer, one sire and one mature cow all of different breeds that were good blue ribbon stock, the only ones out of a hundred or more head that had the blue blood and the blue blooded style or type. These, often pure bred cows, were good, valuable dairy animals, no doubt, but not one had the right to a prize as either Jersey, Holstein, Swiss, or Aryshire. The type was poor. The Holsteins were big black duns and silver grays, but the Jerseys were not Jersified, nor the Holsteins Holstienesque. Now, lest this be misunderstood I will tell you of a cow I raised that won out for several years at the State Fair. She was a great producer and had a right to her ribbon as a dairy cow, but no right to it as a Holstein, as she was off type. Her breeding was gilt edged but she either reverted or was a freak. Her daughters should make good cows by careful selection of the sires they were bred to, probably give good calves, but her sons would have to be vealed.

The Results.

This, not condemning the sons of high producing cows, that are freaks, pulls down the breed. Why? Because the form or type has been built up by rigid selection and the animal is in balance. Heart, lungs and milk organs as well as stomach capacity are able to work together. Change one ever so little, decrease the heart or lung capacity and the cow is not as good an animal physically. Then use her son to head a herd and to pass on the ill-balanced capacity and the stock is running to seed rapidly. The freaking propensity is very strong when it breaks through the long established inheritance and must be watched that it is suppressed in the female decendants and wiped out by not using a sire that has any freak blood in him.

Balance.

Have you ever thought about it in regard to a cow? If it was not the result of the inward modifications of the cow how did it result? The Jersey for instance has had short grasses and a tether strap in her home. The people wished butter, not milk, and the lack of heavy grass has brought it into the cow type. Then the nerve system became tense to fit the nervous energy of fat production. The Holstein stood in heavy grass, the people wanted milk for cheese and the amount of milk became the feature rather than butter-fat. The cows grew bulky and heavy, gentle and tranquil as they gave out great volumes of milk. Now if you should conclude to raise the fat production of the Holstein, the fight has to be kept up to hold her size.

The increased milk flow of the Jersey in the United States has increased her size somewhat of late years. Therefore, the outward is after all a part of the inward form. When we lose sight of the type we are forgetting that the breeds must be bred each to its own particular form. If you do not like a small cow stop raising Jerseys; if you do not like a big cow stop raising Holsteins.

No one should try to make any pure breed of cattle to fit his idea except after constant studying of them at their best. I do not know where this training can be received, for the fairs do not give it. They simply give the ribbon to the best animal of its breed on exhibition. The animal may be the best at that fair and yet a scaly specimen of the breed. I saw in three hundred head of cows and heifers only seventeen that were typical and fine examples of their respective dairy breeds. I saw many, many lovely milch cows that were well worth owning, at the fairs, but imperfect as types of dairy show cows.—M. E. Sherman.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Owners of Live Stock in California Should Insure in Their Own Association,

THE CALIFORNIA MUTUAL LIVE STOCK INSURANCE ASSOCIATION

BECAUSE . . .

It is the only institution of the kind organized under the laws of California with the home office in this State.

We insure live stock against death from disease, fire, lightning, tornado, cyclones and every casualty; also through accident which may necessitate the death of any animal.

Losses are paid promptly without discount and without unnecessary delay.

We have a guaranty deposit under the control of the State Treasurer for the protection of our members and policy holders.

There is $100 of values lost to farmers by death of stock, by disease and accident, where $1 is lost by fire.

We have no dividends or profits paid to idle office holders.

The business of the Association is conducted as economically as is consistent with good management, and the earnings are divided among the policy holders.

This is an age of Mutual Insurance, and it is true the cheapest and strongest companies in the United States to-day are composed of and managed by the policy holders, who are farmers and stockmen, as has been demonstrated in the East.

The directors and officers are elected annually by the policy holders.

WHY PAY LARGE PREMIUMS FOR PROFIT TO EASTERN COMPANIES WHEN YOU CAN CO-OPERATE WITH YOUR FELLOW FARMER AND STOCKMAN AND SECURE YOUR INSURANCE AT COST?

A Few of the Many Testimonials We Are Receiving Daily

Fresno, Calif., August, 29, 1908.

California Mutual Live Stock Ins. Ass'n.,
Los Angeles, California.

Gentlemen:—

We are in receipt of your check for $150, indemnity for the loss of one horse.

We had upon investigation found that your application and by-laws were not complicated, were easy to understand and did not contain so many technicalities as some companies we had investigated that are doing business from foreign states. We also found that this was the only company organized under the State laws of California that was writing live stock insurance in this State. We therefore insured our stock and would not under any consideration do without insurance in your company.

We are more than pleased with the promptness with which payment was made for this loss.

Yours respectfully,
JOHNSON & GREENING.

Los Gatos, August 6th, 1908.

To Whom It May Concern:

This is to certify that I sustained a loss in the California Mutual Live Stock Insurance Association, of which I am a member, to the amount of $350, by the death of two horses. Thanks to the promptness of the Association I have this day received payment in full, through their State agent, Mr. F. H. Hilliker, and cheerfully recommend the Association to all.

I consider it safe, prompt and reliable and an association that all farmers and stock men should go into, as it furnishes absolute protection at cost.

Very respectfully,
FRED LARDER.

Cal. Mutual Live Stock Ins. Ass'n., Newcastle, August 20th. 1908.
Los Angeles, Cal.

Gentlemen:—

Your General Agents, Messrs. Allen & Hunter called on me to-day and handed me your check for $150.00, payment in full for the loss of one of my horses. I certainly appreciate the promptness with which you have met this claim, and I consider it a very good plan to insure our stock against loss by death the same as other property.

I will recommend your Company to my friends.

Wishing you success, Yours resp'y,
RALPH BARNICOTT.

U.S. CREAM SEPARATORS

Hold World's Record for clean skimming

503

CAVENDISH, VT., Sept. 8, 1908.
Since purchasing a U. S. separator one year ago, we have gained $11.37 per cow over the water separator, from our herd of seven cows, though three of these are heifers and one cow had been milked two years.
ALBERT S. EATON.

A saving of $11.37 per cow in one year amounts with 7 cows to $79.59 or within 41 cents of $80, the price of a No. 6 U. S. separator.

Stop and ask yourself, "How much am I losing?" Perhaps not as much as Mr. Eaton, yet you may be losing even more.

You perhaps will say, "The calves and pigs must have something to eat. To be sure they have, but it is not policy to feed them butter fat at 32 cents a lb. when substitutes at one and two cents a pound are just as good.

You can't afford such robbery in your dairy, therefore send for Cat. No. 20 at once.

THE ECONOMIC IMPORTANCE OF ANIMAL TUBERCULOSIS.

Dr. A. D. Melvin, Chief of the Bureau of Animal Industry of the United States Department of Agriculture, in an address before the International Congress on Tuberculosis at Washington, (Tuesday morning, September 29), pointed out the heavy economic loss sustained by the live-stock industry because of tuberculosis and discussed measures for the control and eradication of the disease. Dr. Melvin said, in part:

"While the saving of human life affords the highest motive for combating tuberculosis, the prevention of financial loss is alone a sufficient reason for undertaking the eradication of the disease from farm animals.

"Statistics of the United States Federal meat inspection for the fiscal year ending June 30, 1908, covering 53,973,337 animals, or more than one-half of all those slaughtered for food in the country, show the following percentage of tuberculosis: Adult cattle, 0.961; calves, 0.026; hogs, 2.049; sheep and goats, 0. The proportion of tuberculosis is probably higher in animals slaughtered without inspection.

"Reports of tuberculin tests made in the 15 years from 1893 to 1908 by Federal, State and other officers with tuberculin prepared by the Bureau of Animal Industry have been carefully analyzed and tabulated. Out of 400,000 cattle tested (mostly dairy cattle) there were 37,000 reactions, or 9.25 per cent.

Ten Per Cent.

"From these two classes of statistics it is concluded that on an average of about 10 per cent of the milch cows, one per cent of other cattle, and 2 per cent of the hogs in the United States are affected with tuberculosis, the average percentage for all the cattle being estimated at 3.5.

"The accuracy of the tuberculin tests has been confirmed in a remarkable way by post-mortem examinations. Out of 23,869 reacting cattle slaughtered, lesions of tuberculosis were found in 23,585, a percentage of 98.81. Properly prepared tuberculin applied by a competent person is therefore shown to be a wonderfully reliable agent for diagnosing tuberculosis. In cases where the test appears to give unsatisfactory results this is usually due to the use of a poor quality of tuberculin or to ignorance or carelessness in applying it.

Loss of Millions.

"The economic loss on account of tuberculosis in food-producing animals is heavy. The loss on animals in which tuberculosis is found in the Federal meat inspection is estimated at $2,382,433 annually, and if the same conditions were applied to animals slaughtered for food in the United States would be increased to $4,102,433. The stock of animals on hand is also depreciated in value because of tuberculosis. Assuming that living tuberculosis milch cows are annually depreciated to the extent of one-tenth of what the loss would be if they were slaughtered, other cattle one-third, and hogs one-half, the total annual depreciation amounts to $8,046,219. The annual loss from decrease in milk production is estimated at $1,150,000, and there also is some loss from impairment of breeding qualities, etc. Taking all these items into account, the aggregate annual loss because of tuberculosis among farm animals in the United States is estimated at not less than $14,000,000.

Eradication Necessary.

"Such heavy financial losses make the eradication of tuberculosis from farm animals very desirable purely as an economic matter. As the disease is found principally among cattle and hogs, and as the most of the infection in hogs is derived from cattle, the main effort should be directed against the disease in cattle. Among the measures proposed are the following: Live stock owners should be educated by means of official publications, the agricultural and general press, lectures at farmers' institutes, etc. Public authorities should make a systematic effort to determine to what extent and in what localities the disease exists, and should apply the tuberculin test generally and systematically to cattle in sections where this seems desirable. Reacting animals should be slaughtered under competent veterinary inspection, so that the loss may be minimized by passing carcasses for food where the infection is so slight that this can safely be done; dangerous carcasses, of course, to be condemned. In the case of valuable breeding animals where slaughter would involve great sacrifice, the Bang system of segregation may be used. A system of tagging all cows sent to market is advocated, so that when animals are found tuberculous in the meat inspection they may be traced back to the place of origin, centers of infection located, and steps taken for eradication. The Bureau of Animal Industry is already co-operating with the authorities of some states in reporting and tracing the origin of tuberculous animals. Each state should require that all cattle brought in for breeding or dairy purposes shall have passed the tuberculin test.

"As the eradication of tuberculosis is largely a public health measure it is only reasonable that the persons whose cattle are slaughtered should be paid indemnity, at least in part. This is not only just but is absolutely essential if the co-operation of cattle owners is to be secured. Several states already have provisions of this character.

Profitable.

"The benefits to follow from the eradication of tuberculosis from farm animals are so great and so obvious that the necessary expenditures, even though they must be heavy, may be regarded as a highly profitable investment."

There would be a great many more first-class dairy farmers in the world if they could get this thing of doing the right thing fixed in their minds, because it is right. In every relation of life, with our animals, the soil, our fellowmen and all, the honest policy is the only policy that we can safely trust with our eyes shut.—Hoard's Dairyman.

A pretty good wash for sore shoulders is to put one-half ounce of zinc sulphate into a quart of water and bathe the shoulder at night with it.

For wounds from barbed wire apply carbolic acid, one part, with lard, eight parts. Cleanse the wound first.

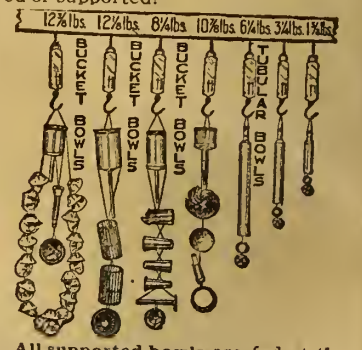
Mistakes Cost Money
Hence the only way to avoid them is to be prepared.
For instance when buying a separator examine it closely, especially the bowl and see if it is simple or complicated; heavy or light; suspended or supported?



All supported bowls are fed at the top, requiring complicated interiors to assist separation. They are not only top heavy, but hard to clean and handle—due to their complicated mechanism.
The three simple bowls on the the right are
TUBULARS
Their simplicity and lightness are evident at a glance---they are easy to clean and handle. The Tubular bowl being suspended and bottom fed, necessitates but a simple smooth interior; because the milk passes but once through during the separation. To avoid separator mistakes, write for and read our catalog 260—free.

NEED OF CAREFUL MILKING.

Every milker thinks he knows how to milk, but if the cows could speak, they would probably intimate that a few lessons in the gentle art would not be out of order. It is not fair treatment to sit down to a cow and tug and haul on her until she steps around in the stall and acts as if she were badly hurt. Sometimes a cow will stop eating and wait until the ordeal is over before she will resume her meal. The cow that does that is usually not comfortable, and an uncomfortable cow will not do her best. Some men have a way of milking that so pleases the cow that she clearly shows her satisfaction. These are the men whose methods should be studied. They never shout at, strike or otherwise illtreat their cows. They sit down quietly, take hold of the teats gently, no matter how much of a hurry they may be in, and begin to draw the milk without pressing too hard, for they know they are touching her at a tender point. Then they keep steadily at it until the last drop is out. There is no excuse for having a kicking cow in the herd. The kicking cow is almost always made so by her attendant. If a cow is handled before she comes in so as to become familiar with her attendant, and has been kindly treated, there will probably be no trouble. It is my opinion that in nine cases out of ten, where there is trouble of this kind, it serves the attendant right to get a good kicking. I think if all milkers would do a little thinking, a little sound reasoning, and investigate matters a little, they would probably find sore teats a common cause for a kicking cow. Instead of using the much-talked-of straps or ropes, I should advise them to use a good remedy. One which has proven effectual without a single exception is simply clean lard. About 15 or 20 minutes before the cow is milked the first time, the lard should be applied to the teats, and when through milking wipe the teats perfectly dry with a soft dry cloth and apply the lard again. This was usually found necessary for about five or six milkings. Many milkers have the bad habit of wetting their fingers when milking, and when the teats of young cows are left in this condition, they get sore. On the other hand, lard heals or takes away the soreness that is so natural, caused by the action of rough, hard hands upon the teats that are not accustomed to the milking process. I once visited a farm where they had a fine young Holstein cow which had just freshened for the first time. The milker and the poor animal had gone through almost everything during the first three milkings. The cow had no means of expressing her sufferings except with kicks, and the owner, although a kind, intelligent person, could not think of other methods to apply except what he had used so often with other cows—tying her with straps or ropes. He decided then to let her keep her calf, as it seemed an impossibility to milk her. It was then that I happened to have my attention called to it, so I told him of our method which at that time we had tried only with three or four young cows. He laughed at me when I suggested that I would apply the lard myself. But the poor cow's teats were now so sore she would not even let the calf touch her. With considerable patting and rubbing and kind words I had the satisfaction of getting the lard applied, and the still greater satisfaction of seeing the cow stand perfectly still a short time afterwards to the great astonishment of those present.

The cow is a creature of habits, and upon the attendant depends the formation of these habits. The more regular they are the better work she will do in the dairy. Teach the young boys to be kind to the cows, to feed them properly, and do everything in their power to make them contented and happy. The true dairy cow usually possesses a highly nervous temperament, that rebels against harsh treatment. In view of this fact, it is ill-advised economy for the dairyman to share with the farm dog the duty of caring for her, for if he does, she will in all probability even up with him by giving an ever-diminishing quantity of milk. Gentle treatment is about as important as good feeding, and must be the practice of dairymen if they expect to succeed.—A. F. S., in Kimball's Dairy Farmer.

ABOUT TUBERCULIN.

Certain veterinarians and doctors are writing against the use of tuberculin because they say it fails sometimes. It is a little strange that doctors should take this ground. It sounds foolish for any set of men to demand infallibility or anything like it in the diagnosis or treatment of disease. The question is, what is the most reliable means of detecting the presence of tuberculosis in the animal? Is there anything more reliable than tuberculin? If not, what is the use of all this gab about "failure," lack of reliability, etc.? Plenty of men have cleaned their herds of this disease by the use first of tuberculin to detect it, and then by exterminating the diseased animals as fast as they were detected, and proper disinfection. Is there any better way to get rid of the disease? —Hoard's.

DAIRYMEN

Your cows are either making money for you or eating their heads off.

Figure it out. Would it not pay to use less of high cost fodders and more sugar-beet-pulp at the low price of 50 cents per ton?

If it is milk you want you will get your money back with profit, besides you will improve the condition of the animals.

And don't wait too long before arranging to silo some of it for use after the factory closes down.

Write, Los Alamitos Sugar Company, Los Alamitos.

Considerable grain sowing has already been done in the Imperial Valley.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

—Politics and— Cream Separators

The manufacturer of a much advertised cream separator, sold mainly by implement dealers, is out with an announcement to employes that if Bryan should be elected his factory will have to at once close down. Regardless of political preference everybody may judge for himself of the propriety of threatening employes in this manner.

But if this separator factory does close down it will not be because either Taft or Bryan is elected, but because of the sweeping success of the new 1908 line of Improved DE LAVAL machines, which has already "closed down" most attempted competition.

So far as DE LAVAL machines are concerned, there are going to be just as many cows and just as much milk to separate whether Taft or Bryan is chosen President, and the well informed buyers of separators are going to put their money into DE LAVAL machines in as large proportion one way or the other, and do so in constantly increasing proportion as comparative separator merit becomes more a matter of actual knowledge and less of mere catalogue and advertising claims.

We are not in politics and not trying to dictate to other people how to vote, but we are in the separator business and are trying by every justifiable means to bring about the universal use of DE LAVAL Cream Separators because of their overwhelming superiority in every feature of separator practicability.

PREPARE YOUR GROUND.

Speaking of irrigation in the Irrigation Age, T. S. Van Dyke urges the thorough preparation and leveling of the land before irrigation. He prefers kid gloves to rubber boots. At first blush we would prefer the boots. However, he says:

"When properly done irrigation is kid glove farming with this important difference, that the nearer it comes to kid glove farming the better it pays. A writer sent out by an eastern magazine to write up the subject says you must learn to wear rubber boots. On the contrary, you must lay out the ground and manage the water so that you can irrigate in slippers. The same difference runs through the whole subject so that when it is well done, it is the easiest and most profitable work in the world of equal certainty in results. There is positively no chance in the game. That is why you never find the alleged funny man in the West cracking any jokes on the irrigating hayseed. He has too much respect for him, because he keeps a robust balance in bank and has plenty of time to play. That is probably why farming was respectable among the Romans and others of the olden days. And what can relieve the congestion of our cities, which is now our danger point, except something that will make farming respectable by making it profitable and easy? The cradle of civilization, of philosophy, art, music and literature was not rocked in the rainy lands, but beside the irrigating ditch. Irrigation has supported the world's largest and richest populations. Our ancestors came from the cold and murky woods of Europe and knew nothing but to hew down forests, dig out stumps and depend on the direct influence of the capricious clouds. Had they come from the sunlands and landed on the Pacific Coast and worked eastward the greater part of the population and wealth of our country today might be west of the Mississippi and the Indian question confined to the Atlantic Coast.

RECLAMATION.

A vast body of land lying between Feather and Sacramento rivers in Sutter county has always been covered with water during a portion of the year and of little value from an agricultural point of view. In fact it has sold at from $15 to $25 per acre, notwithstanding the fact that it is some of the richest land in the world. Engineers have figured out that to reclaim this land will require an expenditure of perhaps $15 to $20 per acre. Once this expenditure is made and the land made tillable it will immediately become some of the most valuable of the lands of the state. It is claimed that $200 will be a low estimate of its market value. That the reclamation scheme is practicable has been assured by the engineers and re-affirmed by the government engineers who have gone over the entire ground. Capitalists are now taking hold of the proposition and it appears that an expenditure of from one and a half to two million of dollars will be made and one of the richest garden sections of the state will be brought into being. This covers practically one half of the area of Sutter county and will afford homes for 10,000 people.

TWO MILES LONG.

One small fruit section of this state will this year send out enough fruit, that if placed in one train it would be over two miles long. This section is Newcastle, up in the Sierra foothills east of Sacramento and is only one of many sections that are attracting attention in this wonderful state. Notwithstanding the financial depression shipments this year are nearly twice those of last year, and the income brought to the state will be vastly greater notwithstanding there have been disappointments in net returns to the producers.

Watsonville is another section which is sending out a vast quantity of apples which will bring a competence to many of the growers of the Pajaro valley. The great citrus section of the state with its 30,000 cars of fruit which would run into miles and miles of trains is a still greater example of the growth of the fruit industry of California.

Let the discouraged fruit grower who has found his crop taken by insects or disease take heart and determine to add to the great output of this wealth producing commodity.

WE ARE NOT KICKERS.

Complaints are heard in all directions about the early rain. Hundreds of sacks of beans are out, walnuts are falling and will turn black because of the wet, sugar beets are suffering, planting of peas, beans, etc., is delayed. Then, too, none are prepared for winter yet, the wood or coal is not laid in, in many cases. In others, perhaps the chicken house is not built and the poultry is out in the rain; broken umbrellas are not repaired, rubbers are worn out or lost. In fact, the rain has taken us by surprise and we are not ready for it.

Just the same, we are all thankful. Oh, of course, who ever heard of a Californian who was not thankful for a rain?—Santa Ana Register.

PATRONS OF HUSBANDRY.

While there are not at present as many granges in this state as there were a few years ago there is yet a strong working force which is proving of great value to farmers in the sections where the grange is in existence. All told there are now in the state 35 granges. Five different counties have organized the Pomona Granges. The average membership of the 35 granges is about 80 members.

This organization is in no sense political other than questions which may affect the welfare of the farming community. For instance the Grange is now actively at work urging the adoption of Constitutional Amendment Number One which permits the revision of the State taxation scheme. The Grange is also working for the adoption of a law permitting a state association to organize a mutual co-operative fire insurance company, the same as mutual life insurance associations are now conducted. In questions such as these affecting the welfare of farmers the Grange is always active but partisan questions are absolutely forbidden discussion in Grange halls.

ENGAGE THE TREES.

Once before the Cultivator mentioned the wisdom of placing an early order for fruit trees required for next season's planting. It now appears that in many lines at least there will be extensive planting and the present, or for the next few weeks, will be the most opportune time for making choice of trees. At this time almost any variety in any desired quantity of all kinds of sorts can be secured from nurserymen. Later, when the rush is on and everybody pressing for their desired varieties, there will be less probability of satisfactory service by the nurserymen. Now, an order placed can be booked and early planting secured as soon as the proper time arrives for taking up the trees. Above all we believe that better service will be had by buying Coast grown trees. California has troubles enough without any other pests being introduced on "perfectly clean" imported stock.

The early buyer will get the best trees.

CELERY CULTURE.

One of California's most profitable industries is that of celery culture. Orange county is the greatest producer while other counties along lower Sacramento and San Joaquin rivers are developing much fine stock and will prove large producers.

We give this week an excellent paper on celery in different sections of the country in which the superior qualities of California celery are shown. Next week another on method of culture will be given.

THE PANAMA CANAL.

"Think what the proposition is—cutting a canal through fifty miles of hills and rocks, actually levelling mountains, to unite two great oceans; think of the almost incalculable amount of excavation, the figures to express which would well nigh stagger the arithmetician; think of the building of the Gatun Dam, the greatest dam the world will know; think of the immense locks, each 1,400 feet in length and you may possibly form an approximate idea of an enterprise which has aroused the nations of the world to wonder."—Claude N. Bennett.

COMING INSTITUTES.

J. B. Neff, who is director of Southern California Institute Work, reports the following coming institutes: Covina, October 23-24; Ontario, October 28-29; Arlington, Riverside county, October 30-31; Rosedale, Kern county, November 16-17; Farmers' Hall, 12 miles southwest of Bakersfield, November 18; Wasco, Kern county, November 19.

"The paramount need of the time is an adequate supply of thoroughly trained leaders in this cause. It is true we need well-equipped men all along the line. But in the higher realms of research, college and university education, and broad organization for the promotion of agriculture we need a large number of men with much more training than is ordinarily given in the agricultural college. Without these leaders the real advance of our agricultural interests will be slow and halting.—Dean True.

Shop Talk

SOMETHING FOR NOTHING.—On another page you will find an order blank for the use of new subscribers to the Cultivator. It provides that those using this blank who are not now getting the paper will receive it the balance of 1908 and all of 1909 for the regular yearly price of $1.00 It is an opportunity for your friends, relatives and neighbors and we will appreciate your suggesting it to them. Do it now. The sooner the order reaches us the sooner the paper starts.

Agricultural Notes of the Pacific Coast

Northern California

The levee along the river in front of Yuba City is being raised.

There will be considerable planting of alfalfa about Gridley, Butte county.

The Healdsburg Grange recently discussed Constitutional Amendment Number One, favoring it.

Anderson, Shasta county, has shipped 66 cars of Bartlett pears this season, all to Eastern markets.

The loss occasioned by the recent Humboldt county fire runs up into the hundreds of thousands of dollars.

Second crop wine grapes in Woodland are all picked. Wine grapes of that section will amount to about 300 tons.

Apple orchards near Ferndale are bearing large crops this year, but the fruit is not up in quality to that of last year.

The Must Hatch Incubator man of Petaluma has made a shipment of 200 White Leghorn chicks to India. They will be two months on the way.

Yolo county farmers were given an excursion to the Hamilton Sugar Factory in an effort to encourage greater production of beets in Yolo county.

Quite extensive showers fell last week in Sacramento valley and were given a hearty welcome by nearly all producers. In Siskiyou county it amounted to 1.9 inches.

A shipment of four carloads of cattle from Biggs, Butte county, calls attention to the fact that the live stock industry of that section is assuming large proportions.

Reclamation District No. 7 in Sutter county has called for an installment of 10 per cent. of the assessment. This will bring in for reclamation work of that district about $20,000.

Sacramento Valley Sugar Company advertises that it is ready to make contracts for 1909 delivery of beets at 2½ cents for every tenth of saccharine contained in the beets.

Wine grape growers near Lodi met recently to discuss the slump in wine and it was stated that larger quantities of wine are now stored in California than for many years.

Special meeting of the California Live Stock Breeders' Association is called for Saturday of this week at Sacramento. S. B. Wright of Santa Rosa is president of this association.

Some grape growers who have signed the $6 per ton contract for wine grapes this season are disconcerted over the fact that some wineries in San Francisco paid as high as $18 and $20 per ton.

The Alameda Sugar Company announces that it will pay 50 cents per ton more for beets than last year. This will cause much greater planting than this season. This company suffered this year from lack of beets caused partly by short planting and partly by the dry season.

Central California

A Farmers' Institute will be held at Rosedale, Kern county, November 16-17.

Another fire occurred in an apple drying house at Watsonville but did slight damage.

Farmers at Panama, Kern county, will hold an institute at Farmers' Hall November 18.

Atwater, Merced county, has 3000 acres of peaches planted of which about 500 are in full bearing.

Visalia orange growers are fumigating for red and yellow scale, which have infested the trees there for some time.

Watsonville sent a supply of apples to be distributed to the American bankers gathered in convention at Denver.

Tulare county claims that she will begin shipping oranges by October 20. There are some splits showing in the orchards.

Papers in the central part of the state maintain that their county fairs made a much finer showing than the state fair did this year.

A corporation has been formed for the purpose of planting mesa land east of Kern City to oranges. There will be about 164 acres planted.

One train load of produce was shipped from Lodi recently in which were 19 cars of Tokays, 21 of wine grapes, 2 of watermelons, and 2 of barley.

The Commercial League of Santa Clara, discussing the good roads movement, has resolved that automobiles should be taxed to aid in the good road movement.

The almond crop near Lodi is proving much larger than usual, and cars are now going forward. Each car is valued at about $3500. That district will have upward of 375 tons.

It was reported that there have been formed in this state over twenty incorporated companies for the purpose of growing eucalyptus. Much of this will be planted in the San Joaquin Valley.

Kern County Fair at Bakersfield this year was a little shy on agricultural exhibits and decidedly long on freak side shows, but it is a step in the right direction and it is hoped it will lead to a good agricultural fair.

Raisin growers of San Joaquin valley are discussing the question as to who has the oldest raisin vineyard in the valley. The Hanford Sentinel maintains that a vineyard near that city planted thirty years ago has the honor.

An experiment at Lodi in putting a car of Tokay grapes in cold storage in a round house to test whether Eastern buyers were making honest reports in the matter of grape decay, showed that a large amount of mold attacked nearly every box. This will probably lead to pre-cooling experiments.

The long standing litigation between members of the California Raisin Growers' Association to secure the return of money overpaid to some members by others who were underpaid in the final windup of the affairs of the association has been decided. This will compel the return of the amount overpaid.

Southern California

Riverside has shipped this year 6140 cars of citrus fruit.

One land owner in Brawley will plant 160 acres to eucalyptus.

Orange growers at Highlands are finding considerable splitting of oranges.

Coachella valley cabbage growers are anticipating good prices for this fall crop.

Corona reports quite a showing of red spider with not much damage done as yet.

A Los Angeles company of capitalists will plant 100 acres to eucalyptus at Banning.

Cotton growers in Imperial valley estimate that at least 2000 acres will be planted next year.

Coachella valley, Imperial county, is planting extensively of crystal wax and Bermuda onions.

Tustin, Orange county, has developed a new bean which is running about 30 sacks production per acre.

Tustin orange growers are busy with fumigation tests, a thorough cleanup being given to all orchards.

It is claimed that brokers handling the Southern California walnut crop will receive a brokerage of over $120,000.

Coachella ranchers are talking of the advisability of growing camphor trees, claiming that $450 per acre can be made.

Eucalyptus experts are looking over the lands in Moreno and Winchester sections with expectation of large plantings there.

Imperial valley cantaloupe growers are hoping for the establishment of a pre-cooling plant before the next melon crop is shipped.

While the bean crop in many sections will be short of what it used to be the price is becoming more satisfactory and will even things up.

Orange county sugar beets are reported of exceptionally high sugar percentage this year. Some fields run as high as one-fourth sugar.

The August pool of lemons in the Santa Ana Lemon Association gave to the growers 3 cents per pound for fancy fruit and 2 cents for lower grade.

The marketing of the apple crop of Yucaipe valley develops the fact that this is a great apple section, some exceedingly fine apples being forwarded this year.

Imperial Valley cantaloupe growers are getting closer together in the effort to formulate a plan for the more successful marketing of their product another year.

Scipio Craig of Redlands reports that the Irrigation Congress at Albuquerque had lighter attendance than in former years but that there were representatives from more foreign countries than ever before.

The Mutual Orange Company of Redlands held a meeting recently and elected the following directors: A. Nichols, president; George R. Stone, vice-president; A. B. Cowgill, secretary and manager; Charles F. Woehr, Burgis W. Smith, R. B. Lane, A. K. Smiley, Dr. C. S. Lombard, directors; Howard Andrews, superintendent of the packing house.

The Coast

Walla Walla county, Washington, has formed a Farmers' Union.

Arizona is considering the advisability of cactus planting on desert stock ranges.

Utah Beekeepers' Association held its annual convention in Salt Lake City last week.

Much injury to fall crops has been caused by drouth in the section near Pullman, Washington.

Wenatchee, Washington, has shipped 36 carloads of fruit to Australian markets this season.

Tomatoes at Harrington, Washington, are now bringing to growers in that section nearly $1 per crate.

The Farmers' Union at Walla Walla, Washington, united in making a Union exhibit at the county fair.

Milton, Oregon, has a nut grower who is succeeding in raising almonds, getting a large crop this season.

Clarkston, Washington, is producing peanuts and has succeeded exceedingly well during the past season.

Thousands of heads of cattle have been purchased near Loomis, Washington, to be shipped on at some later date.

One apple orchard near Waitsburg, Washington, needed 12,000 feet of lumber as props for over-burdened trees.

Owing to bad roads in which dust is very deep at Harrington, Washington, farmers have been unable to deliver wheat.

Long strings of teams are daily hauling their loads of apples to the packing houses at Wenatchee, Washington. A good price is being received.

More apple trees are in full bearing near Pullman, Washington, than ever before and the output has brought exceptionally good returns this season.

Enterprise, Oregon, finds its land adapted for the raising of sugar beets and anticipates the early establishing of a sugar factory.

Washington State Berkshire Breeders' Association recently met at Spokane and elected E. A. Bryan, Pullman, president, and J. H. Smith, also of Pullman, secretary.

Farmers along Snake River, Washington, are having a bonanza this season between crops in catching salmon in the river and selling by the wagonload through the country.

North Yakima has sent 100 boxes of the best apples produced in that section to China, being its first shipment. It is hoped to develop in the Oriental market a demand for Washington apples.

Farmers of Utah have adopted the slogan "The state helps those who help themselves." Consequently are quite generally taking advantage of the Farmsrs' Institutes to secure best information along agricultural lines.

The State Penitentiary at Walla Walla, Washington, has been unable to sell a large portion of the grain sacks manufactured in that institution. This is said to be due to the fact that the Farmers' Union purchased largely through private parties who early in the season sold lower than the state authorities.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used those machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

70c Eggs

Will they sell for that this season? Some say so. Will you get your share of this good money? More reason than ever with feeds so high that you should feed a scientifically balanced ration.

Egg-More

is not a strong tonic and stimulant, but a highly nitrogenous, concentrated Poultry Food, very rich in protein. A little fed daily with good grains will keep hens healthy, make them molt early, feather out quickly and lay lots of eggs. Have you tried it? Many have and are pleased. Here is just one:

F. W. Healy, the well-known banker and fancier of Pasadena, writes: "After hearing others praise Egg-More, I determined that if there was anything to keep hens laying through the fall and winter months, I wanted it. I bought a package of Egg-More and fed it and the improvement was very marked. Keeping on with it I soon proved the truth of your statement that 'you can't put all your eggs in one basket if you feed Egg-More.' I have raised poultry nearly all my life and for twenty years in California, but never did my hens lay so well as since I began to use Egg-More. I consider it the best egg producer on the market, and I do not intend to be without it."

You better try it. For sale by many dealers. If not by yours we will prepay freight on 12½ lbs., $1.00; 25 lbs., $1.90; 50 lbs., $3.60; 100 lbs. $7.00

Are you in the race for any of our

$50 Cash Prizes

$20 first, $10 second, $5 third, fifteen $1 each. Easily earned in an hour or more by any boy or girl, man or woman, but only one in each family, without any cost to you, and no peddling or canvassing. And to each one competing we will also give a useful article. Send postal for particulars, mentioning this paper.

West Coast Mill

707-709 So. Griffin Ave., Los Angeles, Cal.

Mammoth Bronze Turkeys

Unusual success with this years early hatched birds enables us to furnish the finest lot of breeding stock (both hens and toms) ever offered before. If you are a turkey raiser improve your flock with one of our large handsome toms raised on free range and hardened to all kinds of weather. If you are not a turkey raiser start now with one or more hens and a tom, as of all poultry, turkeys are the biggest PROFIT MAKERS. Order early as the first orders take the pick of several hundred birds. Prices on application.

After January 1st, we can furnish hatching eggs from our S. C. White Leghorns, the best laying strain in Southern California. Let us book your order now.

STUHR-WILLIAMSON POULTRY COMPANY

378 Bandini Ave. **Home Phone 1490** **Riverside, Cal.**

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FRUIT FOR POULTRY.

A VERY great deal has been said about the effect of "garden sass" etc. upon laying hens. (A great deal has also been said about the effect of said hens' onslaughts upon the gardens of the temper of the owners thereof, but that is another story.)

It is asserted that the seeds of watermelons, especially, are very injurious to poultry, causing leg weakness, so I have been watching the effect of them upon my own flock with interest. My birds have been confined to a grain diet for some time before we moved, excepting a little processed oats and barley occasionally, and they had dropped off in egg production very materially.

Down here they were turned loose for a time, with unlimited range, where they could help themselves to cabbage, onions, melons, tomatoes and alfalfa galore and the wreck of a garden left testifies to their appreciation of their privilege. They ate the cabbage to the bare stalk. They ravaged the melon vines of all they could hold. They ate the tomatoes by the peck. They picked every leaf off the beets and then ate the beets themselves. They scratched every onion out of the ground, nabbed every peach that fell, and paid attention to the figs as soon as they began to ripen, even trying to get up into the trees after them. They had their grain twice a day, regularly, wheat, barley, and oats by turns, and when I finally got down here where I could see after them, I was surprised at their bright, happy appearance. And they were laying everywhere. Under the barn, out in the weeds, in the wood-pile, in old barrels and boxes, eggs galore.

They had not had an ounce of meat of any kind, a bit of charcoal, nor even the imperative shell, yet they were well, happy and productive. Now my twenty years experience with hens has taught me that they can safely be allowed any amount of green stuff, if their grain ration is supplied just as regularly as though they had nothing else. Too many people drop off the grain when fruit and green stuff are liberally supplied, believing that the birds are getting enough to eat without it.

This is a very serious mistake, as they need the grain to round out their ration, just the same, and where this practice is followed, no ill effects will be caused by any amount of "garden stuff" and fruit. In fact the real danger is in witholding these juicy morsels, which supply the bulky food the fowls must have. A hen will eat just so much, no more and can generally be trusted to balance her own ration, if given a choice of a variety to select from.

I recently saw a statement about bread being obtained at one cent per loaf. Wish I knew where I could get a regular supply. I would soak it in milk if I could possibly get it, then mix it stiff with wheat bran, and what a food it would be. Lacking the milk, I should use water and one-third corn to two-thirds bran with excellent results. The bread alone would be too starchy for perfect food, I should fear.

But I should feed whole grain of some kind for supper, just the same, and try to furnish something for them to pick at all day, if they felt so inclined, if only a raw potato.

KILLING POULTRY.

Now that fancy market poultry is sold with head and feet attached to the body, the old-fashioned way of cutting off the head with an axe is no longer up-to-date, says a writer in the Farmers' Tribune. A knife is now generally used. Poultry is also being sold undrawn and hence it is very desirable that the birds be made to fast from 20 to 24 hours before killing. That is, they should receive no solid food for 24 hours before killing, but they should have all the fresh water they wish. This prevents loss in weight and also helps clean the crop and the intestines. Any water that may be found in the crop may be squeezed out while the bird is bleeding.

The following method of killing a bird in preparation for market is given by the Connecticut (Storrs) Experiment Station in a recent bulletin:

The actual killing of the birds is a simple operation, but for it to be entirely successful two things must be secured—thorough bleeding and speedy unconsciousness, with attendant relaxation. Suspend the bird by the feet at a convenient height by means of a strong cord having an easy running slip noose. Take it firmly, head to the front, under the left arm. Held in this position its struggles will not interfere with subsequent operations. Take the head in the left hand, forcing the bill open with the first and second fingers. Insert the knife in the mouth, carrying the point well back and make a deep cut across the upper part of the neck at about the point of junction with the skull. This should sever the large blood vessels located at that point, and if blood immediately runs in a steady stream the cut has been properly made.

The bird should now be stunned in one of two ways, sticking the bird in the brain or striking with a club. The former is the best after once learned, but is more difficult for the novice, as it seems necessary to pierce a certain portion of the brain in order to secure the coveted result—a relaxation which releases the feathers and permits rapid picking without great danger of tearing the skin. When piercing the brain in this way do not withdraw the knife after cutting the blood vessels, but thrust it up through the roof of the mouth into the back part of the brain and give it a half turn. Then insert in the lower mandible one of the hooks attached to a small receptacle, and all of the blood will be caught. Should extra weight be needed to keep the bird's head still it may be secured by partially filling the pail with cornmeal. If the stunning is to be done with a club use the knife to start the blood, as directed above, and then hook the pail into place. Next grasp the bird by the wings or body and strike it a sharp blow upon the back of the head, thus immediately rendering it entirely insensible to pain. A sudden spasmodic stiffening of the muscles is the sign that the blow has

been effective. Strike squarely, as a glancing blow will often peel quite a piece of skin from the head, making it unsightly.

Although stunning the bird is not necessary when the feathers are to be removed by scalding, it certainly is more humane to do so.

EGGS IS EGGS.

Let us sing the praise of the Great American Hen, who, during the past year, may well have cackled with pride over the production of nearly one billion three hundred million dozen of eggs! Do you realize what that means? Well, listen:

If, instead of remaining quietly at home, she had chosen to demonstrate her powers to the universe at large, the Hen might have laid those eggs, each two inches long, end to end in a continuous chain reaching 238,818 miles up to the moon, back again, and then more than half way around the world for good measure—a total of 492,424 miles of eggs! Furthermore, if those eggs had been made into one omelet half an inch thick, that omelet would easily have covered Manhattan Island, an area of twenty-two square miles!

An old Mohammedan legend tells that King Soloman used to travel through the air with all his armies on a wonderful flying carpet, protected from the rays of the sun by the wings of a host of birds. Now, according to the poultry census, there are in the United States about two hundred and eighty millions of chickens, guinea fowls, turkeys, geese and ducks of the poultry voting age, which is three months or over. If required to furnish a moving canopy like that of King Solomon, the barnyard fowls of this country, allowing only a foot of spread to each, could easily shadow a space of ten square miles.—Arthur Guiterman in October Woman's Home Companion.

BOWEL DISEASE.

Bowel disease occurs in young chicks as often and, indeed, more frequently from chill than from improper feeding. Warmth to chicks under six weeks old is as important as food. Do not be tempted to let them run out on the grass in the early morning, nor do they need much exercise when young. Cut sods of clover and place them in the brooder yard. This gives them all the green food they need and also ample exercise. If given too much liberty while very young they come to the brooder at night with but little desire to eat their meals. The crops may appear full, but one is unable to judge of the contents, and in many instances the crop is all bulk and the food affords but little nourishment. It is well enough to let older stock roam, but push along the little birds for laying, and well matured birds before next winter's cold weather sets in. Feed as great a variety as possible.

SKIM MILK FOR LAYING HENS.

The Department of Agriculture has received a report from the West Virginia Experiment Station of a test made to determine the value of skim milk as against water for wetting a feed mash.

In the first test, which covered 122 days, 22 hens fed skim milk laid 1244 eggs, as compared with 996 eggs laid by the 22 hens fed mash wet with water.

In the first period of the second test 60 hens fed the skim milk ration laid 862 eggs in 37 days as compared with 632 eggs laid by a similar lot fed no skim milk. In the second period the rations were reversed. The chickens fed skim milk laid 1220 eggs in 56 days, as compared with 978 in the case of the lot fed no skim milk. In both experiments more eggs were produced when skim milk was substituted for water for moistening the mash. Under the conditions prevailing in these experiments and with eggs selling for 20 or 25 cents per dozen the skim milk used for moistening the mash had a feeding value of from one and one-half to two cents per quart. In these trials 802 quarts of skim milk were fed, resulting in an increase in the egg production of 702 eggs.

DRY FEEDING.

The system of dry feeding has been known to wide-awake poultrymen twelve or fifteen years. None who have been successful have ever used a slop or sloppy foods for their poultry. Successful poultrymen do not feed gallons of milk, sweet and sour, in open vessels to their poultry. All of this kind of material is made use of for mixed mash-foods, which are always mixed into a dry, crumbling consistency by those who understand their business. Poultry are not slop-eating animals; slop should go to hogs. Poultry in their natural state always subsist on seeds, grains, and the grass bugs and worms. The source of the greater portion of all diseases of poultry can be traced to the liver. The feeding of soft mash-foods for several generations to poultry brings about the diseased condition of the liver.

CONDITION POWDERS FOR POULTRY.

The use of pulverized cayenne pepper or capsicum, so often advised and resorted to, is discouraged by experienced poultry raisers, on account of its strong, penetrating and almost poisonous nature. While it may prove beneficial for the moment, after its influence has been dispelled it leaves the system more enfeebled than at the outset and in its stead the following compound is recommended: Carbonate of iron, 1 ounce; anise seed 2; powdered ginger, 6; mustard, 1; table salt, 2; sulphur, 2; licorice, 4; powdered charcoal, 14. These should be powdered and mixed thoroughly making two pounds of good condition powders, and if kept in a tight box will be good for a long time. A tablespoonful in ten quarts of soft food, or in that proportion, fed every other day in warm weather, or every day in stormy or cold weather, will prove of service. For growing chicks, one-half of the amount of powders in the same quantity of feed is sufficient. A tablespoonful of the tincture of iron to each gallon of drinking water should be provided in all bad seasons. —Epitomist.

MOLASSES FOR FOWLS.

Quite a number of people are feeding molasses to fowls. Some report success, some are undecided, others condemn its use. For growing or fattening fowls it has value, but must be more fully tested before it can be called of value for laying hens. No one has so far developed a perfect ration for its use. Many have used sugar and molasses for fattening fowls for years. Five per cent. sugar in mash is frequently used. —Country Gentleman.

EXTERMINATING MITES.

If lice mites remain in the coops after chicks have been taught to roost in the houses, burn them out with a torch as soon as the coops are deserted by the chicks. Dry "cat-tail" saturated with kerosene make the best torch, but if these cannot be obtained, a corncob fastened to the end of a stick and dipped in kerosene will answer.

In burning, the coops should be removed to an open space where there is no litter to become ignited. Hold the torch close to every spot on the inside for several seconds. This is a rather tedious process, but it exterminates these pests, as far as the coops are concerned.

Don't set a deep dish out for the chicks to drink water out of. You know why. Shallow ones, filled often, are far better. The fountains now on the market are fine things.

Excelsior Egg Food

Mr. W. W. Howard, the White Leghorn expert, is feeding Excelsior Egg Food exclusively. Mr. Howard's flock is noted as an egg producing strain. If you are not getting satisfactory results, try Excelsior Egg Food.

Excelsior Scratch Food

Is just what you have been looking for. Give it a trial and you will never be without it.

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before. Coulson's balanced ration poultry foods are guaranteed to contain nothing but wholesome ingredients.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full particulars of guarantee and directions for feeding and care of poultry from the time they are hatched. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

Coulson Poultry & Stock Food Co.
Petaluma, Cal.

Germain Seed Co., Los Angeles
Distributing Agents for So. Cal.

POULTRY SCRAPS.

Get rid of the culls as early this fall as possible.

Keep turkeys, ducks, geese and hens in separate quarters.

Feast one day and famine the next is a money losing policy.

Lots of cold storage eggs on the market, but fresh eggs are always in demand at better prices.

Keep the pullets intended for winter layers in separate pens this fall. Food for them should be varied. Give them some green food daily. Keep grit in pens at all times.

The new plan is to sell eggs by weight and is done in some parts of the East. We know of a farmer friend of ours whose wife picks out all the large eggs for home use and sells the others. There's economy for you.—Successful Farming.

ALAMEDA COUNTY SHOW.

E. K. Healy, Superintendent of the coming Alameda County Poultry Show, which will be held in Idora Park, Oakland, December 7-12, writes that there is already promise of a fine show this year. He says: "We expect to have at least a 1200 bird show with a dressed poultry and egg department beside. Our hall is 100 by 200 with perfect light and ventilation which, with our up-to-date coops, make it the prettiest show room in the state. We hope to see a large entry from all parts of the state. Judge Gardner of New York will place the awards. To have this well known judge of national reputation pass on birds will be well worth shipping a long distance. We will offer about fifty cups, besides cash and special ribbons."

Clean out the nest boxes often. Hens like a neat place to drop their eggs in. If you do not believe it, just watch and listen to a hen when she finds a neat box to get into. Her talk about it is wonderfully interesting and instructive, as well.

Don't force the chicks too hard at first. Like everything else, it may be overdone. A chick that has been fed too high is pretty sure to turn up its toes.

The best friend of the poultryman in fighting mites is kerosene oil. Apply it freely in all the cracks and crevices, and they will soon vanish.

To keep mites out of the henhouse, use whitewash and sprinkle ashes all around under the roosts. The ashes will do the business.

If you like white hens, get them around. Pick out a hen as you did your wife—because you love her.

Scaly leg is caused by a parasite that lives under the scale on the leg. Rub with an ointment made of ½ pint of lard, 2 teaspoonfuls of kerosene and 1 teaspoonful of powdered sulphur. Use this once every four or five days, and the trouble will disappear.

One farmer of Moscow, Idaho, recently made a display of forty different agricultural and horticultural products from his 160 acre farm at the state fair.

The egg market at Seattle, Washington, is good and stiff with quotations running from 46 to 47 cents.

Petaluma poultry men are struggling with great numbers of rats which destroy young chicks.

Buy Chicks Now! Don't Wait

We can sell you baby chicks right now as low in price as when eggs are much cheaper. We can ship safely anywhere within 48 hours. **WE HATCH** 19 varieties of poultry. Send today for price list; it gives full details how we sell and ship chicks, etc. We have satisfied customers everywhere. We guarantee you a square deal. We originated this baby chick business several years ago. Our sales, in 1908, exceeded 230,000 chicks, ducks, turkeys, geese, etc. We hatch all of them in season. Write us today. Call and see us—visitors always welcome.

108-110-112 E. 8th St., Los Angeles, Cal.

Bees and Their Care

HOW THE BEE DOES IT.

Bees gather honey from the nectar vessels of flowers and plants. The sugar, starch, albumen, etc., are carried up by the sap to the seed-bearing pods. To a marked extent nature is assisted by the natural law of heat and cold to produce a sweating or condensation of moisture, which we call dew. This takes place in the corolla of the flower, making it more easy for the plant to deposit its overflow of sugar, starch, albumen, etc., in the dew already in the flower. This sweet nectar is carried up by the sap and discharged in the dew through the pores of the plant. When the sun rises evaporation takes place and the result is a tiny drop of nectar in the cup of the flower. The bee goes to the flower and with its long, silken tongue sips up this drop of nectar and deposits it into its honey sack back of the throat. The bee is provided with a stomach for its physical well being back of this storage stomach and all the honey that goes to this stomach is used for the life or physical demands of the bee. When the bee has its storage tank full of nectar it straightway flies to the hive and exudes it into the cell. The bee is endowed with the power of exuding as naturally as in-taking, so there is nothing wonderful about it except the natural curiousness of the matter.—Denver Field and Farm.

BEES ON SMALL FARMS.

Friends of the busy bee sometimes urge the keeping of bees because they can be made to yield a profit without the owner forfeiting or giving up any other occupation to which he may have been devoting his attention. There are a number of branches of farming with which beekeeping fits well, such as fruit raising, dairying, poultry growing, etc. A correspondent of one of the leading bee journals recently discussed the possibility of so conducting an apiary that it alone might be depended upon as a business. It was admitted that in certain sections of the country it may pay to make a specialty of the business, but it was also declared that a major proportion of the apiaries, especially in the East, are so situated that, for one reason or another, they will not, if managed alone, afford an income sufficient to provide comfortably for a family; while if the apiary is conducted in connection with other lucrative employments, it adds a substantial item to sales, especially on small farms.

In most of the Eastern states the honey flow is very spasmodic, the pasturage in many sections supporting only about 80 colonies to the apiary; and the income varying from $100 to $500. As such a limited number of colonies requires only an occasional day's work in the yard, there is considerable time left for fruit growing, poultry raising and other like pursuits.

Again, if beekeeping goes hand in hand with other branches of husbandry, the general business of the farm will be sufficiently arduous to justify employing an assistant to bear the brunt of the hard work in the apairy also. This will enable a person who is not robust to run a small place comfortably and profitably, when otherwise life would be a painful struggle.

A little farm of several acres will accommodate a good beehouse and yard for 100 colonies, buildings, yards, etc., for 2000 ducklings, as many chickens, 100 turkeys and 1000 or more pigeons; also a good vegetable garden, about 30 fine apple trees, 1000 choice currant bushes, grapes, raspberries and plums, and there will be considerable room for expansion.

The owner of such a little farm, with one helper the year round, and another during the busiest summer months, can keep every part of it in good, healthy, running order, and if the honey season is poor there are the other resources to fall back upon; if poultry fails the honey crop will probably be good.—Coleman's Rural World.

When a man or association of men contemplate locating a wagon factory, flour or cotton mill, in fact, any kind of factory except a farm, the first things considered are material from which to make the goods, and a market in which to sell after they are made, at a price that will pay cost of producing and marketing, and enough more to yield a dividend on the amount of money invested. When the farmer understands both the science of producing and marketing he will take place among other business men instead of being the one producing those things most needed and receiving the least profit for his skill and labor.

The greatest precaution should be taken by all beekeepers to prevent foul brood. If any foul brood cells are touched wash the hands in a solution consisting of corrosive sublimate one ounce with a gallon of water, to kill all germs. These germs are known to live for a number of years and although we have no way of determining definitely just how long they will exist we believe they will remain for a period of ten years.

Poorly attached combs in sections seem to be more the result of weak colonies and a poor honey flow than of the kind of starter used, although large starters and strips of foundation in the bottom of the sections help to strengthen the union of comb to the section. Separators between the sections are essential to the best results in producing comb honey.

AGRICULTURAL EDUCATION IN CALIFORNIA.

Continued from Page 392

of agriculture and of education are working together to provido courses and equipment specially designed to meet this great demand and notable service to those desiring special qualification is anticipated.

The University rests, in fact, under an obligation to do this, for it has fostered and promoted this demand for industrial subjects in the schools and has taught the advantage of their introduction by its own example. In a recent public address Dean Davenport of the College of Agriculture of the University of Illinois, alludes to "the powerful influences of universities in shaping educational sentiment and ideals not only for themselves but for the secondary schools as well. * * * Agriculture led in the original movement for industrial education, as it is now leading in a revival of sentiment which some of us believe will bring to the surface the real purpose of education and put it in a new light before the people, viz.: Education for Efficiency."

Dean Davenport has used a term which is grand in breadth and at the same time as narrow as an individual need, and he shows how universities have become strong "by teaching the branches of knowledge especially related to the industries of life and their success has shown not only that learning may be useful without losing its educative value, but that all branches of learning are both useful and educative and thereby worthy of being taught to somebody."

As the agricultural colleges of our state universities have thus demonstrated a popular need, ministered to its adequate supply and thereby suggested a new and true educational ideal and purpose, it is clear that agriculture in the universities should be maintained and provided for liberally and not allowed to struggle under the handicap of inadequate buildings and meager equipment. The University of Southern California has the distinction of having a poorer agricultural building than any other university in the United States. It is forced to require thirty teachers and assistants to handle classes with an aggregate enrollment of 715 in a main building which cost $10,000 ten years ago, supplemented by a collection of sheds which have been enlarged and patched up until it is hard to tell what were their original forms and colors. And yet both teachers and scholars are struggling on, full of interest and enthusiasm, because they have faith in the worthiness of their work. They should not be longer subjected to limitations and deficiencies which no other State will tolerate. Millions are expended each year by other States to house and equip agriculture in their universities as well or better than other applied sciences. California through the last two legislatures has dealt liberally with the extension of university agriculture both in research and instructional lines, but the proper provision for the source of such efforts in the central life and activity of the university itself has not yet been secured. There will be another chance during the legislative session of 1909, and we of the staff who are trying to do the work well, earnestly ask your help to the end that a structure worthy of the leading industry of California shall rise among the great permanent buildings of the University.

FLAX IN CALIFORNIA.

Interest in flax culture in California is growing and many inquiries have come to the Cultivator as to the possibilities of profit from the sale of the product and from the benefit to the soil by the use of flax as a change crop.

We are informed by J. C. Everding, who is contracting for flax seed, that at the present time there are about 30,000 acres planted to flax in this state. Of these, 8000 are in the Sacramento valley, about 10,000 in the San Joaquin, 4000 in Southern California, and 7000 in the Santa Maria Coast country. Eighty per cent of this is under contract, and the men who manufacture linseed oil, oil cake or meal, are ready to contract for more.

An important argument for raising flax in California is that with a larger production of flaxseed there would be an increased manufacture of oil in the state, ensuring a large supply of linseed cake and meal for stock feeding. Stockmen must have these feeds because of their large content of protein. Hence those who want to assist in upbuilding the live stock industry of California will welcome the increased use of flax as a change crop.

It has been proved that flax is no greater drain on the soil than wheat and that it is a valuable crop to use alternately with whatever cereal is grown in the various localities. Rotations successfully practiced in North Dakota, as given by J. H. Shepperd, are: wheat, flax, oats, barley and fallow in Benson county; two crops of flax and then two of small grain in Ramsey county; corn, flax wheat and oats in Cass county; two years of wheat, flax, wheat again, and then oats, in Grand Forks county. Tried rotations both here and abroad prove that flax is a valuable change crop with any of the cereals or grains. In fact the crop coming after the flax is usually of improved quality, possibly because the finer root system of the flax leaves the soil in an improved condition.

Another advantage in the use of flax in the rotation of crops is that it can be put in with practically the same labor supply and teams, and harvested with practically the same outfit of cutting and threshing machinery as is now used for wheat, barley, or oats.

The day of intensive farming, of the small acreage exhaustively tilled by the owner who does not count his own labor, has not yet come to California except in certain limited areas. The large grain fields cannot lie fallow. They must have crop rotation. The change crop, to win adoption, must be equally profitable and must grow naturally under the same general conditions. Flax, which will grow in a wide range of soils, in either a hot or cold climate, which makes a winter growth as the grains do, and which, moreover, seems to have a ready home market, would seem to solve the problem for a great part of California.

BOOST IT.

Forestry and Irrigation, a magazine and official organ of the American Forestry Association, realizing the opportunity to greater usefulness, is making special effort to enlarge its field by making a special offer on subscription. Any one interested in irrigation or in forestry should write for a sample copy to the American Forestry Association, 1311 G. St., N. W., Washington, D. C.

Every farmer should take an interest in the forestry question. It vitally concerns the farmer as well as others.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Orange Twig.

A subscriber at Pomona recently sent a small twig of orange tree which indicated diseased condition. It was referred to Prof. Smith of the Pathological Laboratory, who writes: "Your correspondent's letter is too indefinite and his specimen too imperfect for me to attempt a diagnosis. From the wording of the letter one might surmise Exanthema, but the enclosed twig does not show the characteristics of this malady. If W. D. will write a more explicit letter or send an unmistakably characteristic specimen from one of his diseased trees, the Laboratory would be in a better position to come to his aid."

The name signed to the letter, as we made it out, was W. David, Pomona. A letter to that address was returned, however, and we suggest that the writer do as Prof. Smith recommends and give more particulars, so that he may be able to give more explicit information.

Roselle Jelly.

Please give receipe for making jelly from Roselle or jelly plant.—I. M. T. Cammanche.

Gather the calyces by breaking off the entire blossom stem. Do not allow to get too ripe or there is danger of stringy jelly. Place in the porcelain, graniteware or aluminum cooker and add water, perhaps to two-thirds the height of the blossom "pods" in the vessel. Some cut the pods so as to secure quicker cooking, but most people think it superfluous. Boil a few minutes until the mass is thoroughly cooked through. Strain the juice, after which boil ten minutes and add an equal amount of sugar. Boil ten minutes again and test by dropping in water or by putting a few drops on a cold plate or saucer. If done when dropped in water it will cohere, while if not yet done it will dissolve in the water.

Black Walnut Root.

Will you recommend planting black walnut and grafting to English or is the ordinary soft shell root better? Land is a canyon 15 miles from the ocean, soil very rich, chalky formation, quite mellow. Has raised good beans. Holds moisture well. Cannot be irrigated. Is the black root graft an experiment or an established fact? Does blight affect walnuts as much in the mountains as in the valley? Does extreme heat have any effect on this variety? Is there risk in planting under such conditions? What is cost?—A. P., Oxnard.

These questions were referred to Mr. J. B. Neff, who writes:

Native black walnut trees have better root systems than the seedling softshell, and will do better than the softshell where the land is poor or moisture deficient, but there should be a rainfall of 25 inches on very retentive soil, if the best results are to be obtained without irrigation. Grafting on native black walnut roots is not an experiment, as it has been practiced in the central part of the State since 1891, and there are some grafted trees with a spread of 60 feet across the branches.

Altitude does not have any influence on the walnut blight, but there is always less blight in a dry climate than in the moist coast regions.

Extreme dry heat is very likely to burn the nuts on one side and particularly so when moisture is deficient.

The risk consists principally in a series of dry years and in order to minimize the risk the trees should be planted not closer than 60 feet.

The item of cost will vary according to whether you plant seedling black walnut trees and do your own grafting, or buy grafted trees to plant. The first will cost but a few dollars per acre, while the second will cost about $15.00 per acre. In any event you should plant only resistant trees or use grafts from resistant walnut trees.

Vetch for Green Manuring.

What is best vetch for growing to plow under for green manuring for Santa Clara county? Will Canadian field peas make a good winter growth and will mixed sowing of peas and vetch be desirable?—Prune Grower, Santa Clara.

The vetch most generally planted and considered the best is Vicia sativa. It is possible it would do well planted with Canadian field peas, which alone are used probably as extensively as the vetch. The vetch, however, makes a better winter growth, that is, in cool weather succeeds better than do the peas. The seed of either may be had of the seed houses advertising in the Cultivator. Burr clover is also an excellent plant for the purpose, and we believe would do fully as well planted with Canadian peas as the vetch. However, we do not know that anything would be gained by mixing the seed.

Stable Manure.

Which is best, horse or cow manure, providing they are well cultivated or plowed deeply into the ground? How much wood ashes can I put upon a place planted to 20-year-old orange and lemon trees?—H. J. L., Pomona.

The best manure depends more upon feed than upon the animal from which it comes. The manure from a cow fed on alfalfa hay and messed heavily with bran would be worth far more than that from horses fed on a straw stack. If used in large quantities, cow manure is much less liable to burn small roots if plowed in deeply. If the horses are heavily grained and bedding carefully arranged so as to preserve liquid manure, it will also prove an excellent land dressing. From experiments made at Cornell University the following general averages are obtained. The manure from cows contained .50 per cent nitrogen, .29 per cent potash, .45 per cent phosphoric acid, with a value at that time of $2.37 per ton. Manure from horses contained .47 per cent nitrogen, .94 per cent potash, .39 per cent phosphoric acid, with a value of $2.79. Analysis at the same time of manures showed the value of that from sheep to be $4.19, swine $3.18, hens $4.22. Of course, bear in mind that the value of any manure depends upon how much it has been leached out, the

feed of the animal, the caro with which it was gathered, etc. As to the quantity of wood ashes to apply per acre, we cannot give definite information, but with limited quantities possible to obtain in this country at this time, we do not think there is danger of an over application.

Wickson Plums.

I send samples of plums of very desirable variety growing on a tree on my place. Tree is a slow grower, pendulous branches, fruit ripens September 10 to 30, quality exceptionally fine, fruit very large, heart shaped, flesh greenish yellow, pit small.—G. O. Lanpher, Gardena.

This fruit was shown to Prof. Clarke, State University, and he thinks it is an exceptionally fine strain of the Wickson.

Lippia.

I read an article in a recent Cultivator regarding Lippia repens, a creeping lawn plant. Where can I obtain a start of it, and will it spread and become a pest? Is it a forage plant for stock?—W. E. A., Watsonville.

We should think you could secure this plant from your local nurseryman, but if not, the Southern California Acclimatizing Association, Santa Barbara, who originally introduced it, or probably any nurseryman advertising in the Cultivator can supply you. It will not become a pest, and is easily eradicated when desired. While it has been claimed to be a strong enough grower to eradicate morning glory, we do not know whether it would do that or not. It would surely need encouragement by keeping down weeds until it is thoroughly rooted. In the yard of the writer it has proven very attractive to poultry, who run to it immediately on being let out of their corral; but as to whether stock would find it agreeable, or whether it would live under grazing we are not prepared to say.

Packing Prunes.

How are prunes, after they are dried, prepared and packed in boxes? Namely, what kind of dipping solution is used? Also can you tell me what prices prunes command, four standard sizes, packed in 25-pound boxes?—L. F. J., Wrights.

The process of packing consists of first sizing the prunes, 40-50s, 50-60s, etc., after which they are run through a bath of hot water, or sometimes hot water to which glycerine has been added in the proportion of one pound glycerine to 20 gallons of water; or more commonly the bath consists of a syrupy solution made from cooking cull prunes until syrup is extracted. After the dip in this boiling solution the prunes are drained and immediately, while hot, placed in the boxes. The price of the boxed goods is usually half a cent to five-eighths of a cent in advance of the regular sack basis quotations.

Chemical Content of Vegetables.

Please state different chemical elements and their percentage in Hubbard squash, tomatoes, onions, and blood beets. I wish to know their value as diet for diabetes.—Subscriber, Hemet.

We have not the information at hand, but would refer our subscriber to a bulletin published by the Office of Experiment Stations, Department of Agriculture, Washington, D. C., entitled "Composition of American Food Stuffs." In a general way, diet for that particular trouble should be food without sugar. Squash and beets would probably be objectionable, and tomatoes and onions desirable.

FRUIT TREE TROUBLES.

Continued from Page 389.

He recommends as a spray material for pruno rust, a carbonate of copper solution made by dissolving an ounce of carbonate of copper in a quart of strong ammonia. Add seven or eight times its volume of water and add the powder gradually till all of it is dissolved, when add enough water to make nine gallons. Spray the first time just after the trees are out of bloom and again when a fair amount of wood and foliage has formed. The disease so weakens a tree that it will not bear good fruit, if any, the year following the destruction of the leaves.

Gum Disease.

The gum disease of the apricots is easily controlled if taken in time and need cause but little loss; splitting the bark a few inches apart and from the ground to the large branches will allow the gum to escape, while if the gum has no outlet it will be forced from place to place under the bark and often girdles the tree. Splitting the bark is often beneficial in the absence of gum, as when a tree has a bark bound appearance. When trees of any kind have bark that is darker than usual and of a shiny appearance, splitting the bark is very beneficial.

There are seasons when the small branches become affected, gum clear and firm, forcing beads at points of exit. These branches sometimes die when new shoots will start from below the point of gumming.

The deadliest and most hopeless disease of the apricot is sour-sap. Trees will show a slight lack of vigor and in a day or two will die so suddenly that the leaves will dry up green. Occasional trees or a group of trees in one orchard will suddenly die. There is no known remedy for this for the mischief is done almost before it is evident. —J. W. Mills, Marysville.

ORANGE COUNTY CARNIVAL OF PRODUCTS

The products of Orange county were placed on exhibition in the city of Santa Ana last week and attracted thousands of people to see what could be grown on Orange county soil. Pumpkins by the thousand and of a size that was astounding were used in all kinds of decoration. A trolley car constructed of peanuts was a factor, a mission constructed of corn another, and many such features added to the interest. The sugar beet exhibit was quite extensive and a "sugar factory" constructed entirely of cube sugar attracted attention to the fact that Santa Ana hopes to have within the next few months a "for sure" sugar factory in full operation. One sugar beet weighing eighty-five pounds was exhibited, the product of Orange county soil from seed sown last spring. No claim was made that this beet contained any great percentage of sugar but it surely was an example of wonderful growth. Walnuts were of course a great factor as they are one of the strongest features of Orange county's productions.

The parades with costumed people and a duly crowned queen leading the procession of the products arranged on floats was of course a factor each day. It was a most creditable exhibit and should attract much attention to that rich county.

Petaluma is elated over the fact that she has secured the meeting of the State Grange for 1909.

ROCK ME TO SLEEP.

Backward, turn backward, oh time, in your flight!
Make me a child again just for to-night!
Mother, come back from the echoless shore,
Take me again to your heart as of yore.
Kiss from my forehead the furrows of care,
Smooth the few silver threads out of my hair;
Over my slumbers your loving watch keep—
Rock me to sleep, mother, rock me to sleep!

Backward, flow backward, oh tide of the years!
I am so weary of toil and of tears—
Toil without recompense, tears all in vain,
Take them and give me my childhood again!
I have grown weary of dust and decay,
Weary of flinging my soul wealth away:
Weary of sowing for others to reap—
Rock me to sleep, mother, rock me to sleep!

Tired of the hollow, the base, the untrue,
Mother, oh, mother, my heart calls for you!
Many a summer the grass has grown green,
Blossomed and faded, our faces between,
Yet, with strong yearning and passionate pain,
Long I tonight for your presence again.
Come from the silence so long and so deep—
Rock me to sleep, mother, rock me to sleep!

Over my heart, in the days that are flown,
No love like mother love ever has shone;
No other worship abides and endures—
Faithful, unselfish and patient, like yours.
None like a mother can charm away pain
From the sick soul and the world weary brain;
Slumber's soft calms o'er my heavy lids creep—
Rock me to sleep, mother, rock me to sleep!

Come, let your brown hair, just lighted with gold,
Fall on your shoulders again as of old;
Let it droop over my forehead tonight
Shading my faint eyes away from the light,
For, with its sunny edged shadows, once more
Haply will throng the sweet visions of yore.
Lovingly, softly, its bright billows sweep,
Rock me to sleep, mother, rock me to sleep!

Mother, dear mother, the years have been long
Since I last listened your lullaby song;
Sing, then, and unto my soul it shall seem
Womanhood's years have been only a dream.
Clasped to your heart in a loving embrace,
With your light lashes just sweeping my face,
Never hereafter to awake or to weep—
Rock me to sleep, mother, rock me to sleep!

—Elizabeth Akers Allen (Florence Percy)

SATAN IS ACCOMMODATING.

"When you feel any temptations comin' along," said the friend and adviser, "you mus' say, 'Get thee behin' me, Satan."

"Da's what I done said," answered Mr. Erastus Pinkley, "an' den I 'magines I hyuhs Satan answer me back, 'Da's all right. We's both gwine de same way, an' it don' make no dif'unce to me nohow which leads de puhcession.' "—Washington Star.

THE SWORD CANE DUEL.

"ONE of the most singular features of human nature," remarked the anatomist, "is the breaking up of love between two persons when one dies."

"Love does not necessarily break up in such an event," replied the psychologist.

"I don't agree with you. Love after the death of the being loved is simply memory."

"Cases of actual love between the sexes are very rare—one in a thousand. They are not mere memory after death; they are immortal."

"Can you give me such a case?"

"Yes, one. It is the only one that has ever come to my knowledge. Listen and I will relate it.

"Douglas Bissel knew the moment he set eyes on Caroline La Cour that she and he had been appointed by Providence to be lovers. Miss La Cour recognized the fact at the same instant. Bissel was a young Northerner who, after being graduated at college, went to New Orleans as a teacher. Miss La Cour was a creole. Their love came as a child is born—that is, a perfect thing, though it grew as the child grows. It cannot be said that it was a case of that turbulent evanescent love which comes with extreme youth, for Bissel was thirty years old when they met, and Miss La Cour was twenty-five. It was unalterable from its inception.

"It was the woman who was taken away. She died during one of the epidemics of yellow fever that occurred about the middle of the last century and but a few weeks before they were to have been married. Such partings—partings between beings in whom there is real immortal love—are terrible. Miss La Cour in all the physical agony of death resulting from that awful disease did not suffer bodily as the lover suffered in soul, and when all was over he fell into a stupor from which his friends despaired of ever awakening him. He never was again the same man.

Bissel never married. He lived alone. If he had a companion it was his wife. He told others that there was such a companionship, though when he attempted to explain it he failed signally. He could say rather what it was not than what it was. For instance, she did not visit him. It was not one of those cases where one broods over a grave. The mortal part of his love was placed in a tomb provided for it, and Bissel went there but seldom. He did not consider what was there as being any more a part of his love than one of her gowns. She was elsewhere.

But one day when he made one of his periodical visits to the tomb to see that the premises were in condition he met with a surprise. He found a man weeping before it.

"'Pardon me,' said Bissel, 'we have a common sorrow. You must be the brother. I often heard my love speak of him—he who was living in South America.'

"'I was not her brother. I am her lover.'

"For a few moments there was silence, during which the two men regarded each other with a strange expression on the face of each. Then Bissel spoke:

"'You say you are her lover. That is my position.'

"'Pardon me, it is mine.'

"'Do you mean to assert that she ever loved you?'

"'She did. We met in Paris. She was eighteen. I offered her my love, and it was accepted. Circumstances which I do not care to reveal parted us.'

"'Strange,' replied Bissel, half to himself, 'that she never told me of this—affair.'

"'There was no affair. It was an undying love.'

"'On your part, not on hers.'

"'I believe she loved me always. I believe she loves me now.'

"Bissell carried a cane. It was one of those sword canes very much in use at that period. Taking it in both hands, he partly drew the blade, then thrust it back.

"'Pardon me; I forgot that you are unarmed.'

..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Cultivator Publishing Company

"'You mistake; I am armed.' And the stranger drew from his own walking stick a similar blade.

"'Fortunate,' said Bissell, drawing his steel. 'She whose mortal part lies there is mine. You dispute her possession with me. We cannot both have her. One must give place to the other. But, mind you, if I fall she is still mine.'

"There was a fervor in the last four words that could scarcely have been equaled had the object been a living being.

"'It seems to me,' said the stranger reflectively, 'that we are about to fight for that which has no real existence.'

"'Your words show that this love you speak of in your case is not real love. And she—she never considered it worth while to speak of it to me, though perhaps she may have considered your preference for her as sacred.'

"The words angered the stranger. His eyes flashed ominously, and he placed himself on guard.

"One of the workmen in the cemetery, hearing the clash of steel, rushed to the La Cour tomb, but only in time to see Bissell fall pierced through the heart. His antagonist was unhurt."

The speaker paused. He seemed to consider that he had established his point.

"What place," asked the anatomist, "do you give the stranger in this trio of love?"

"None at all. In a year he was married."—Sacramento Union.

The Personal Neatness Club

IT is not so much "what" as "how" one wears their clothes. Likewise "when" enters into the problem. The knack of these points is seldom acquired. The girl with plenty of money has no advantage in this respect. A little careful observation and training is valuable for any girl.

Don't Overdress:

Many a beautiful costume is spoiled because it is worn at the wrong time; nothing is so vulgar as being overdressed.

It takes some little while to know just what to take away in the summer, for one is apt to arrive at the seashore with the most perishable clothes, that would only stand the dry atmosphere of the mountains.

* * *

HABITS OF PERSONAL CLEANLINESS.

When one has formed good habits of personal cleanliness they have taken a long step toward good health as as well as to good looks and one of the best things a mother can do for her children is to furnish them with the articles necessary to a refined toilet and start them in right habits. Nothing should interfere with the morning grooming of the mouth and teeth and the thorough brushing just before going to bed. Neglect will not only cause the teeth to decay, but will make the gums weak and unhealthy, and every woman who has any respect for her looks should devote at least a few minutes every day to the improvement of her appearance.

If the skin is not bathed often it fails to act, then the liver becomes sluggish also, and numerous ills follow in its train. Black heads are nothing more nor less than an accumulation of dirt in the tiny pores of the skin, and the best way to keep them off is to wash your face and hands night and morning, using plenty of pure soap and hot water into which has been thrown a small lump of borax to soften the water and keep the skin firm.

The hands are washed clean of disease germs that might infect the body, and the face and eyes are cleaned of floating dust, and a noted beauty specialist says that he has become firmly convinced that lack of common, ordinary cleanliness was the root of nearly all skin blemishes.

To make a mouth wash that will keep the gums and mouth in a healthy condition add one ounce of borax and one half teaspoonful of spirits of camphor to one pint of water that has been boiled. The borax purifies the mouth and disinfects decayed teeth which are a menace to health, and the best way to use this solution is to add a little to warm water and brush the teeth and wash the mouth out with the solution.

We know that to have a sound mind we must have a sound body and three things are necessary to good health; cleanliness, pure air and a proper diet.—M. A. T.

* * *

HEALTH NOTES.

Cold applications strengthen the heart.

The best cure for biliousness is fasting.

The baby is not hungry every time it cries.

Gouty persons should eat freely of carrots and apples.

Lemon juice will more thoroughly cleanse the skin than soap.

Injudicious eating and drinking will make the pores of the skin large.

Table salt rubbed into the scalp will stop the hair from coming out.

Every one should drink at least two quarts of water during the day.

All starchy food should be thoroughly cooked, and slowly masticated, as an aid to digestion.

A beginning cold can be checked by anything that will set the blood into active motion.

SIMILES IN RHYME.

As plump as a partridge—as poor as a rat.
As strong as a horse—as weak as a cat.
As wet as a fish—as dry as a bone.
As live as a bird—as dead as a stone.
As hard as a flint—as soft as a mole.
As white as a lily—as black as coal.
As plain as a pikestaff—as rough as a bear.
As tight as a drum—as free as the air.
As heavy as lead—as light as a feather.
As steady as time—uncertain as weather.

To remove old tea and coffee stains wet the spots with cold water and cover with glycerine, let stand two or three hours, then wash with cold water and hard soap; if all stains have not disappeared, repeat the operation.

To keep butter hard in hot weather without ice, invert a large crock of earthenware, not glazed (size according to the dish containing the butter) over the dish on which the butter is. The porousness of this earthenware will keep the butter cool and hard, and all the more so if the pot be wrapped in a wet cloth with a little water in the dish with the butter.

HOMELY HINTS.

To get good light from lamps, change wicks often. Never keep them until they are nearly used up or get very dirty; keep the bottom of the bowls clean. Boil burners in a strong solution of sal soda. Then polish with whiting or wood ashes. To clean lamp globes easily, wipe off with piece of paper—this saves the wipers from getting so badly soiled; then pour cold water through the globe, polish with a clean, dry rag. The globes always look very clear when treated in this way.

Starch made with soapy water gives collars a beautiful gloss. The soap also prevents the iron from sticking.

Save the raveled threads from old linen to mend your tablecloths and napkins. They match so much better than new thread.

To remove the strong odor from the pans in which fish, onions, and other strongly scented food have been cooked, put the pan over the fire after washing, add hot water and a teaspoonful of soda and boil a little while.

Sift flour lightly over the cake tins after they are buttered. Then shake out all flour except that which adheres to the butter. The flour and butter form a thin crust between the cake and the tin and does not stick to the pan.

To Economize Space in Clothes Presses.

"We have equipped each of the clothes presses in our house with long, nine-inch screw hooks, such as are used to suspend bird cages from," says a writer in Woman's Home Companion for September. "One hook easily holds six skirt or waist hangers. Not only is the available space greatly increased, but 'finding things' is much easier than in a press where small hooks are used and things hang one over another."

To Sharpen Scissors.

Cut them rapidly on the neck of a small glass bottle, or better still, on a ground-glass stopper. It trues the edges and makes them cut like new.

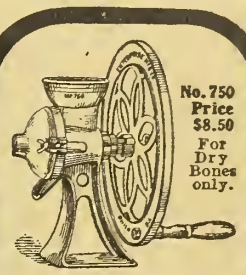
"You should love your neighbor as yourself." "Of course, but there are times when a fellow is considerably disgusted with himself."

Large Family Size. No. 10—Price $2.50.

It is really better to own an "Enterprise" Meat Chopper and cut your sausage meat easily, quickly and well, than to trust to a borrowed machine to "grind" it. The

No. 25. 4 Quart Japanned. Price $5.50. 4 sizes. Tinned and Japanned.

Half the work at butchering time is spent in lard and sausage making. You can increase your products and lessen the time and labor of Sausage Stuffing and Lard Pressing if you use an



No. 750 Price $8.50 For Dry Bones only.

Cracked corn, ground bone, oyster and other shells, etc., are important items of egg-making material and *must* be furnished in winter to secure an abundance of high-priced eggs. They *can* be furnished at lowest cost by the use of an

ENTERPRISE

Meat and Food Chopper

is made in standard family sizes, and not only saves half the work at butchering time, but is useful in the kitchen every day in the year. "Enterprise" Meat Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without crushing, and make tough meat tender. Easily cleaned, practically unbreakable, and will last for years.

Made in 45 sizes and styles; for Hand, Steam and Electric power. No. 5, Small Family size, $1.75; No. 10, Large Family Size, $2.50. Sold direct if not to be had from your dealer.

Sausage Stuffer and Lard Press

Stuffs sausage quickly and uniformly. Patented Corrugated Spout prevents air entering the casing, thus assuring the preservation of the sausage. Cylinder is bored absolutely true. Meat cannot rise above the plate.

Can be changed into a Lard Press in a jiffy. Machine is strongly made and will last for years.

Other famous "Enterprise" household specialties are Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, etc., etc.

Look for the name "Enterprise" on the machine you buy.

Bone, Shell and Corn Mill

Order one early in the season, and the hens will surely pay for it. The mill shown in cut costs only $8.50. Will grind corn, *dry* bones, oyster and other shells, etc., making valuable poultry food. May be used for making boue meal fertilizer.

A good all-round mill for farmers and poultrymen, and for strength and durability is unexcelled. Weight, 60 lbs. Capacity, 1¼ bushels of corn per hour. Look for the name *"Enterprise"* on the machine you buy. Sold by Hardware and General Stores, etc.

FREE—The "Enterprising Housekeeper"—a book containing over 200 choice recipes and kitchen helps. Sent on request.

THE ENTERPRISE MFG. CO. OF PA., 229 Dauphin Street, Philadelphia, Pa.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Send for Illustrated Catalogue with Prices

Hay.

Somers & Co. say:

There has been some little increase in hay shipments during the past week, the total showing 2780 tons as compared with 2370 for the week preceding. The car scarcity is in no way relieved and shippers are still clamoring at all points for accommodations in this connection. The local demand is fairly active and the possibilities for interior shipments are particularly promising at the moment but owing to lack of transporation facilities but little is being done. The choicer grades of hay are in very active demand here and prices seem to be steadily advancing. The medium qualities as usual are neglected and continuing without any material advance over the prices given several weeks ago.

The Government has made no award as yet in connection with the recent tenders for hay for Manila shipment. If the entire contract is let in this city it will surely have a material effect on prices.

CELERY GROWING IN CALIFORNIA.

Continued from page 387.

will be impossible for that section to furnish any great supply for shipment during the latter part of December, January, and the early part of February. The celery grown is considered of good quality and gives entire satisfaction in the eastern market. About 1000 acres are being grown in Northern California this season.

Advises Reduced Acreage.

This covers the celery growing districts of the United States, giving you an idea of the magnitude of the industry as a whole, and of the quality of the product in each state as well. After summing up the situation carefully, we find that Orange county has no real competitor during the mid-winter months, and with the call on the market at the time the Florida comes in you can readily see she must sacrifice much of her crop in order to get in, so to speak. It would be very unwise to plant as large an acreage as heretofore for many reasons.

First, because other sections have shortened our shipping season. As stated above, our early crop comes in competition with Northern California, Colorado, New York, Michigan and other middle western states, while our late crops come in competition with Northern California and Florida.

Second, the trade is demanding a higher standard as to quality and sizes, and with a large acreage, much of which would be on poor land, the crop would necessarily be neglected, resulting in a low grade and inferior article, which not only meahs great waste in grading and unsatisfactory returns, but dissatisfied customers whom we are trying to build up a reputation with.

Third, with a large acreage it would be impossible to give it proper protection from blight during rainy weather when it is necessary to spray often and thoroughly.

By growing a moderate crop of celery, say 2000 cars, and having it ready for market during December, January and February, with quality equal to the standard, we have no hesitancy in saying that the growers will not only receive high prices for their celery, but move their crop without loss, thereby insuring them a good net profit for their investment.

A FINE SPREADER.

From an Eastern Exchange in which an extended description of a manure spreader is written we note the following good points:

This new improved machine is a decided novelty in that the material is pulverized and delivered at the forward and back axle instead of at the rear of the machine. The advantages in favor of the front delivery are lightness of draft, simplicity, low down construction, cut under truck, and for reason of having a covered beater the use of the machine in windy weather or as a lime distributor is practicable.

In this new machine the top of the box will be less than 40 inches from the grond compared with 54 inches in others. This is a decided advantage over other machines on the market.

Although a model of strength and simplicity the machine has valuable features not found in others, having more weight and double the number of parts. Perhaps the very best feature is the complete control of the apron which can be run forward or back, either empty or loaded. This permits of stopping the apron while the beater remains in full operation, or if desired the operator can run the load back from the beater and then start the machine in operation, thereby avoiding partial unloading of the machine by hand and throwing out the material in large chunks when first starting up, which is a great drawback in other spreaders. The apron is thrown out of gear automatically after the load is distributed and also when it is returned for filling the box. The ratchet drive is superior in its operation and simplicity.

This spreader is made under patent No. 818098, dated April 17, 1906, and issued to Joseph S. Kemp of Newark Valley, N. Y., who is recognized everywhere as the "Father of all manure spreaders."

The rights of the J. S. Kemp Co., have been acquired by the Coscaden Manufacturing Co., of Waterloo Ia.

General Agriculture

STICK TO THE STAPLES.

The Hawaiian Forester and Agriculturist has the following on freak farming, which at times appeals to all as a possible chance of greater profit.

Although tropical agriculture offers splendid opportunities for those who engage in it under proper conditions, there are many enterprises which from the nature of things are not likely ever to repay the expense of endeavoring to start them and which careful foresight would have chronicled beforehand among the list of failures.

Among the most profitable agricultural industries are to be included most of those which look to the satisfying of an established food demand, for the market for such commodities increases arithmetically with that of the world's population. It is also found that as education and the general standards of living advance, the per capita consumption of most food stuffs which are not essentially necessary, increases in geometrical proportion. When such articles of diet require special conditions of climate which confine their production to a small proportion of the world's area compared with the diffused market they have to supply, the potential expansion of such industries as the production of tropical fruits, the preparation of vanilla extract, the cultivation of cocoa, of coffee and of tea, when engaged in under suitable labor conditions, are well nigh illimitable.

Another class of flourishing agricultural enterprises, whose future is equally as promising as of the food stuffs alluded to, is represented by such industries as the production of tobacco, rubber and camphor, the prosperity of which industries is, as in the case of former class of food stuffs, dependent upon a rapidly increasing per capita consumption, favorable labor facilities and a restricted area of cultivation.

Generally speaking, when these three elements are present an agricultural industry has every likelihood of succeeding; when one of the elements is uncertain it will be precarious, but when more than one element is not assured the enterprise will be impossible as a financial enterprise. The rapidly increasing per capita consumption of sugar, combined with a relatively restricted area of cultivation, would be unavailing to make this industry a success, were it not for favorable labor conditions, and in proportion as these are unsettled, the industry itself suffers.

Another illustration of the misfortune which is apt to overtake the grower of medicinal plants is furnished by the experience of the attempt to produce quinine in California. The extensive use of this drug and its advancing market value induced many agricultural enthusiasts to advocate its cultivation in apparently favorable parts of California. In consequence of this, extensive planting of the Cinchona plant was carried out in that State about twenty years ago. The industry seemed to promise well, until an unusual fall in temperature stamped out the young plantations. Meantime the price of quinine had declined rapidly until it is now less than a tenth of its former value. Even had the Cinchona plant flourished in California, the present price of quinine, taken in conjunction with the labor cost of stripping the bark, renders it certain that not one pound of the drug would have been profitably produced in the United States.

With regard to the attempted cultivation of Ginseng, of the three requisite elements to success, apart from suitable cultural methods, each is either wanting or at least uncertain. The consumption of the drug is chiefly confined to one country and is, so far as known, not increasing; the labor facilities of the attempted new country of cultivation are certainly inferior to those of China; and the area of possible cultivation is well nigh universal. These three conditions in conjunction prevent the growing of Ginseng from being profitable anywhere but in the country of its consumption.

In the case of the attempt to grow Cinchona in California, besides the fact that the climatic conditions alone proved sufficient to stamp out the industry, one of the elements requisite to the success of tropical agriculture was altogether absent and another was uncertain. On the one hand the per capita consumption of the drug is probably not increasing, and on the other the labor conditions of California cannot in any way enter into competition with such countries as Java, which at present easily supply the world's demand.

Another class of industries which of late years has become precarious on account of the increasing diminution of per capita consumption, is the cultivation of perfumery plants. In this case the synthetic process of the manufacture of chemical perfumes has so improved that in perhaps the majority of cases the artificial perfume is not only equal to the natural, but far less expensive and more stable. The result is that whereas in perfumery growing industries all other elements of success may be present, the decreasing use of the natural perfume has often rendered its production unprofitable. In consequence of this many growers of perfumery flowers in France and other European countries are gradually relinquishing the industry and establishing chemical laboratories for the manufacture of synthetic perfumes.

I am for the harmless snake. I don't believe in beating the life out of every little wriggler that we see just because it is a snake. Why? Because snakes are always helping the farmer in his fight with bugs and other small things that destroy his crops. There are about seventy-five varieties of snakes in the country, but the only deadly ones are the rattlesnake, the copperhead, the coral and the water moccasin. The rest are not only harmless, but consume myriads of enemies of plants. To most people a snake is a snake, and the first impulse on seeing one is to smash him. But the harmless should be let alone.

The Produce Exchange of Imperial valley has been formed to handle the coming cantaloupe output. The following gentlemen were elected as incorporators: Fred Stahl, Peter Hovley, S. M. Bixby, W. E. Wilsie, H. M. McKinney, Will Fawcett, Frank Thing and B. E. Wilhite. It will be a purely co-operative marketing organization.

A land company has established a large nursery at Hunters, Washington.

The French Method of Gardening

Written by Henry Hooper, a Cultivator Subscriber, of Battle Fruit Farms, England, for the Purpose of Correcting Erroneous Ideas of French Gardening Possibilities

The Cultivator recently contained a short article on "French Gardening," which is intensive farming "intensified" and it called forth a query from a subscriber in a later issue. This query was observed by a subscriber and good friend of the Cultivator, Mr. Henry Hooper, F. R. H. S. Fruit Farm, at Battle, England who writes as follows:

I noticed in the Cultivator inquiries on the subject of "French Gardening," for which there is at present a dangerous craze over here. I am sending you under separate cover a copy of the "Estate Magazine;" on page 403 thereof you will find an article on the subject which I penned with the object the article itself discloses. Perhaps what I say may be of service to some of your folks. If so, so much the better.

I am in close touch with matters horticultural—practical and theoretical—in this country, and if you are in want of a contributor on matters of mutual horticultural interest I would try to find time out of a busy life to meet your want.

With best wishes to you and the "growers" of California, I am, dear sir, faithfully yours,

HENRY HOOPER, F. R. H. S.

The Cultivator and its readers will greatly appreciate an occasional letter from Mr. Hooper.—Editor.

OPTIMISM—well founded optimism, that is—in relation to rural industries is no bad thing; in fact, the improvement in our general attitude towards matters rural, which now replaces the pessimism so long weighing upon British agronomy, is very welcome and makes for the national welfare. There is solid foundation for thinking and preaching that, with advancing knowledge and its consequent improvement in methods, a brighter era has dawned for those who toil upon the land; but there is scant foundation for the optimism which preaches that by the imitation of certain cultural processes long in use with a section of foreign gardeners—nor so new to British horticulture in theory and practice as is generally supposed—we may, almost indiscriminately, convert our British soils into gold-producing media of fabulous value.

Let everything legitimate and honest be done to encourage land settlement; but extravagant, ill-considered advocacy of the "back-to-the-land" principle in any of its forms is, like all extremes, pernicious, and can only spread disappointment and disgust when the inevitable disillusionment comes, reawaken that pessimism of which we have already known too much, and defeat genuine and well-conceived effort to promote rural interests.

Into the ears of the really experienced the siren-voiced advocates of this "new" departure warble their dangerous enticements in vain; but the uninitiated, or they of the limited experience, and the dissatisfied lend ears too willing to such bewitching phrases as "gold-producing soil" and "£700 per acre." To these a word of caution is but a duty.

Under correct conditions and circumstances there is money in "French gardening" without doubt—there is money in all skillful culture of the soil; but that money is not to be extracted by the simple process of merely embarking in that, or any other, form of rural enterprise. Far from it; yet, according to the scribes who are responsible for what is little short of a craze for this "new" method of getting rich quickly, there seems little else to be done than to start into it.

To buy a small handbook which will "enable the reader to start the system on a small or large scale," and to follow month by month the cultural practices therein described, seems all-sufficient to transform the casual aspirant into the successful French-gardener. Incidentally the writers mention capital, expenses of labor, manure, and maintenance, but the exact "how much" of these necessities is never clearly defined, possibly because exactness in these matters is very difficult to arrive at by any who have not for a lengthened period been engaged in this form of market-gardening. Doubtless the writers of these guides to wealth honestly believe in what they say; French gardening has, however, been practiced in the environs of Paris for many generations, yet we do not hear that the palaces on the boulevards of that salad-loving city are peopled with retired maraichers.

Let us briefly review this "new" thing from a practical standpoint and discover what further there is to know about it than the handbooks describe and infer, preliminarily to any possibility of successfully practicing it.

"French gardening" is the name we give to the intensive culture of vegetables and such fruits as lend themselves to its processes, as practiced by the maraichers around French cities, notably Paris. The modus operandi is by the use of frames and cloches (bell-glasses) on couches (hotbeds) and highly enriched soils, with rye-straw mats for protection against variations of temperature. The objective is the raising of crops out of season or very early (primeurs.) Horse manure and glass afford the motive power of this culture, and very considerable indeed is the experience and skill requisite to the successful manipulation of these agents.

The making of hotbeds and the maintenance of correct temperatures therein is not within the province of the tyro armed with the best of handbooks, any more than the cultural knowledge essential to the profitable raising of plants under this (or any other) form of gardening is to be acquired without pains and practice. To raise crops of lettuce, carrot, radish, cauliflower, broccoli, beans, celery, tomatoes, artichokes, melons, cucumbers, strawberries, etc., in quick succession (many of them in conjunction), some with full protection throughout their growth, others in part protected and finished in the open, is both costly and calling for cultural ability of a very high order. Only the capable gardener, then, need contemplate the prospect of engaging in "French gardening" with any hope of success, and even he will be well advised to first carefully investigate the methods to be practiced by visiting—working in, if possible—a French garden, and then commencing his own operations on a very limited scale.

The working of a garden on the principles of the maraicher entails over and above very considerable and somewhat special experience as a cultivator, unceasing watchfulness, unlimited industry, high organizing capacity, and a Spartan disregard for the limits of a working day. Nothing can be left to chance, no procrastination is admissible; delays of days or even hours in the performance of any given operation may easily mean the failure of a crop; overheating or a temperature below the requisite may work fatal results in a very brief period; too much moisture (or too little) in forcing culture is quickly vital in its effect. The working of a French garden may be well compared to the running of a collection of incubators unprovided with automatic regulators, and the strain of the task as well as the result of operations will be in direct ratio to the experience and skill of the operator. Of course the multiplication of assistants alleviates the burden on the principal, but it also, and in proportion, increases the cost of production, while unless the assistant be skilled in the same degree as the principal the entire system, or at any rate the relegated portion of it, must break down. So we have as an essential skilled management and skilled help. Will the craze itself create these, or must they be trained as their foreign prototypes have been? And when trained, will the assistants "know no leisure, have no time to live the life of a human being," etc., for the simple wage allowed for in the statistics of the scribes? Probably not; yet even the handbooks hint at this.

Then there is the matter of capital. Let us note what a real "French gardener" engaged in the industry in this country says upon this important point. Though not very exhaustive, this authority is instructive so far as he goes. He says: "The necessary capital for starting a French garden of two acres with a stock of 600 lights and 2500 cloches is £2000, exclusive of the value of the land." Further he tells us that an irrigation system adequate to such a garden must cost £400 for its installation, and adds sententiously that "saving on this item will mean failure in the crops or [? and] giving up this culture." In this connection it is well to remember that while water is essential the indiscriminate use of it may work destruction. On the cost of manure and labor this authority, too, is vague, as also on the point of the needed quantities of both these essentials; but we gather that manure at a given price will cost £240 in the first year.

There is, however, no fixed price for manure—it must vary with locality—but all indications suggest that it will never be cheaper than it is at present, and probably, as the demand increases and supply diminishes, very much dearer.

While any sort of soil may be converted to use for French gardening, the better it is—a nice, light loam, for instance—the better the results will be and the less costly the conversion.

Enough, perhaps, has been said to prove that French gardening is a business not lightly to be undertaken even by such as are already experienced in other horticultural lines; how much less, then, should the inexperienced be tempted to embark in it?

The danger of the over-production of primeurs in England is still remote; too much is required of the successful French gardener to make his name suddenly legion in this country; but there is very grave danger of the over-production of unsuccessful French gardeners as the outcome of the thoughtless vociferousness of the advocates of this "new" departure in horticulture—a danger sad to contemplate and most desirable to avert.

Let us by all means emulate anything and everything of proved worth in foreign methods—we have much to learn in many lines of rural enterprise from our over-sea competitors—but let careful experiment by competent bodies (or individuals who can afford to experiment) ascertain to what extent conditions obtaining with us are suited to the possibly successful imitation of foreign methods before our own people are allowed to be enticed into enterprises calling for personal and material equipment of a kind that few can afford to squander and which may easily be turned to profitable account in more fitting ways.

It is quite desirable that the methods of the maraicher should be put to full and fair test in this country, but it is not well that those to whom failure to imitate the maraicher successfully would mean ruin should in any way be encouraged to do the testing.

"Back to the land" certainly; but for pursuits which will ensure ".staying" upon the land. Dreams of fabulous wealth easily acquired are not sufficient equipment with which to tackle successfully any rural industry, though high hopes of competence and comfort founded upon conscientious effort to accumulate experience are legitimate, and possible as well as deserving of realization.—Henry Hooper.

The Olive

FROM the Cultivation of the Olive by Hillman, published by Wm. S. Meyers, New York, we quote:

"The olive tree responds well and continuously to good cultivation, to irrigation in conditions which call for it, and to application of suitable fertilizers in adequate quantity and in proper season; but if it be cultivated negligently or not at all, it must not be expected to bear remunerative crops.

"It is true that the olive, in a state of nature, is not exacting in respect of soil; it establishes itself on the sides of mountains, among the clefts of the rocks, and amid loose stones, scarcely less well than in the richest and best watered of garden soils. But when it comes to the cultivation of the olive for profit, considerations of climate, soil, irrigation, tillage, and —by no means last or least—of fertilizing, have to be carefully studied.

"The inclination which has shown itself in many quarters to act as if the olive tree might be left to take care of itself, and be expected to thrive and to yield abundantly in circumstances in which no other fruit tree would live, has not improbably arisen from a following of the traditions of olive growing in the Old World, where the majority of cultivators appear to think, either that the soil is a storehouse of plant food so inexhaustible that olive trees of a hundred years' growth will have been unable to deplete it, or that the olive is a tree which consumes nothing, and that it is therefore needless to restore anything to the soil on which it grows.

"The inequalities and intermittency of yield to which the olive is subject when rational fertilizing is neglected, indicate to those acquainted with the subject the default of available plant food in the soil.

Climatic Conditions.

"It is dangerous to plant olive trees in any region where the temperature often falls below 20 deg. F. The olive tree has survived a temperature of 14 deg. F. in California, but the fruit is injured by a slight fall below the freezing point. This tends to render unprofitable the cultivation of late varieties which carry their ripening season into the winter months.

"At 10 deg. F. the whole tree is destroyed. In spring, after new growth has started, a very moderate degree of cold is harmful.

"The tree thrives best in a uniform and moderately high temperature. It will not withstand extremes of heat or cold. As we have seen, 18 deg. of frost is fatal to the tree, while 6 deg. is fatal to the fruit. On the other hand, intense heat, especially in the blooming season may ruin the prospects of a crop. In the matter of climate, the larger part of California is well adapted to olive culture. In the Sierra Nevada range, in 37 deg. North, it is said to do well at an altitude of 3000 feet.

"Its success is assured where the mean temperature of the coldest month does not fall below 43 deg. F.

Soils.

"The olive will thrive in a light, friable soil, moderately warm and moist, rich in lime and potash contents. It will yield scanty crops of fruit of poor quality on heavy, clayey, or ill drained soils. It is a mistake to suppose that the olive will give profitable crops on poor soils without adequate aid by the judicious application of fertilizers.

"The olive requires less water than many other trees on account of its sparse foliage and its strong root system, which penetrates to a great depth even in rocky sub-soils, if they be well drained. It will not, however, produce heavy yields in a soil lacking in moisture. Where the rainfall is deficient, it must be supplemented by irrigation. This must not, however, be excessive, and the water level must be kept low, otherwise the quality of the crop will be inferior and the tree subject to disease."

ABSORBING POWER OF THE SOIL.

We have all seen how rapidly the soil absorbs moisture. After heavy rains we see large quantities of water disappear in the earth, and yet I doubt whether most people realize how much water a certain quantity of earth will absorb and retain. I have two hanging baskets suspended from a wire on the porch of my house. These baskets are made of wire and are first lined with moss. Then potted plants with earth about the roots are placed in the baskets, then the whole is filled with fertile earth. I water these plants every other day. Some people water such baskets every day. I fill a large tobacco pail nearly full with water, estimating that I place in the pail ten quarts of water. In this large pail I deposit one of these hanging baskets which just fits so that the water submerges the basket. After it has remained in the pail until thoroughly moistened, I lift out the basket and place in the pail another basket. After these two baskets have absorbed all of the water possible I remove them and find that they have taken up nearly all of the ten quarts of water. As an experiment in soil absorption this result is astonishing, showing that a given body of nearly dry earth will absorb nearly its bulk in water. This is one of the great provisions of nature without which we could not live on the earth. The soil is full of air spaces, which air spaces take in water when it is applied, but the particles of earth themselves absorb water freely, thus holding it a long time in readiness for the plants growing in this soil. Some soils hold water more persistently than other soils. In light sandy soil the water passes through it and disappears in the drainage, but in soils composed of part sand and part clay, water is absorbed and retained much longer. If the soil contains humus as a fertile soil does the humus adds to the retaining of the moisture.

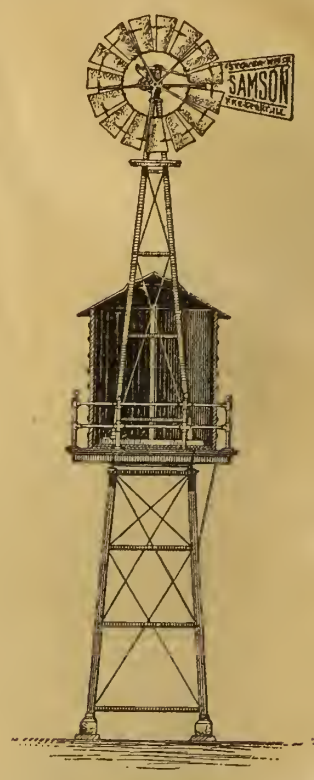
The plants in the hanging baskets drink up water fast. How much they will absorb depends on how long the basket is left in the pail of water.—Green's Fruit Grower.

SOIL AND PLANT.

Above ground the necessities for plant life are sunlight, air, warmth With these the farmer has but little to do. It is his chief concern to see that conditions are favorable below the ground. Here are required air, warmth, moisture and food The air and warmth are admitted into the soil principally by constant and thorough stirring and cultivation, which allows the air to penetrate below the surface.—DR. R. H. LAUGHRIDGE.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

California Horticulturally

By John Isaac

TACKLING THE ANT PROBLEM.

A RECENT visit to the ant laboratory of the University of California, located at Fruitvale and in charge of Prof. C. W. Woodworth, was a revelation in regard to the newly discovered pest—the Argentine ant. Prof. Woodworth has located his laboratory in the midst of one of the worst infected sections in the State, and certainly he has abundant material to work on. This pest is a very minute member of the ant family but it increases in such enormous quantities that nothing can stand before it. It is exceedingly pugnacious and kills out all other species which it attacks. This might be beneficial, were it not that it is so much worse than any of our native species that these seem almost like beneficial insects compared with it. Other ants live in detached colonies and will not tolerate strangers in their midst, whereas with these there is no line of demarcation between one colony and another and all intermingle freely together, forming a practically continuous colony over the whole area where they are found. It is a most serious household pest, and none of the precautions which will check our common species has any effect on them. Furniture legs set in water will stop other species from reaching the tops, but these either cross on a slight dusty film or soon make a bridge of their bodies, across which others can pass. Coal oil will not check them, and so far nothing has been found which will effectively check their spread. It is a threatening danger to the horticulturist and floriculturist, from the fact that it attacks and destroys the vital parts of the bloom, very much as do the thrips. At New Orleans, where this pest has existed for several years, it has killed out the cut flower business, while in many places it has greatly reduced or destroyed the orange crop through its destructive work on the blossoms. Prof. Woodworth drew the writer's attention to an acacia tree badly infested with Cottony cushion scale upon which no sign of Vedalia cardinalis could be seen, a most unusual thing now that this lady-bird is so widely established, but which was accounted for by Prof. Woodworth's statement that the ant attacks the young lady-bird larvae, but spreads the scale for the sake of its sweet exudation. If this is the case, there may be danger ahead from the increase of this old-time pest of our orange groves. In any event, the ant is already a most serious pest where it has obtained a foothold, and it has been reported from a number of widely separated points in the State. Prof. Woodworth is doing excellent work on this pest and should be enthusiastically seconded in his work by all who are in the line of danger from this new pest.

A GROWL FROM THE METROPOLIS.

In San Francisco both dealers and consumers are complaining of the inferior quality of fruit offered in the markets and it is asserted, with some show of truthfulness, that this city is made the dumping ground for the refuse fruit of the State. What the eastern market refuses, is packed and shipped to San Francisco, and the commission men are roundly scored if they do not obtain first class prices for it. Wormy apples are the rule, while California lemons covered with purple scale are common. Lemons that any county, having a board of Horticultural Commissioners, would consign to the flames are here offered for sale in the open market and are allowed to spread the pest into other sections of the state where it does not at present exist. Strangers seeing the fruit offered for sale in the markets of our metropolis would form a very poor idea of our horticultural possibilities, and certainly in the interest of the whole state there should be some means of preventing such stuff being openly hawked about.

THE BANNER FRUIT SEASON

The shipments of fresh fruits during this season have largely exceeded the expectations of even those who were most sanguine. Hon. Alden Anderson, Manager for the Fruit Distributors, through whom the greater part of the shipments of fresh fruit are made, early in the season thought that the season's shipments might reach 10,000 car loads, which would have been very largely in excess of the shipments for any former year, but this mark has already been very nearly reached, and there are yet large quantities of grapes, and the bulk of the apple crop to go forward. It is more than probable now that the shipments for the present season will total, if indeed, they do not exceed 12,000 car loads. This will be 5000 car loads more than ever before shipped in any one season. There is no reason, however, why this should not increase with the coming years. California excels in all fruits and has a practical monopoly in the production of many. Table grapes, apricots and many others are not produced outside of our state, while peaches, plums, cherries, pears and others do here as nowhere else. With a steadily increasing population in the East and a consequent increasing demand for our fruits, with the area of first class fruit land in the Union limited, and the bulk of the best of it within our valleys, there is no danger that fruit growing in California will ever be overdone, or that too much fruit can be planted. Grow good fruit, and the market is open to all we can produce.

ANOTHER UNUSUAL SEASON.

It is not often that Southern California exceeds the northern portion of the state in the volume of its rainfall, but this sometimes happens and there have been instances where the south has been well supplied while the North has suffered from drouth. A phenomenon along these lines has been afforded by the late September rains which were copious in the South but decreased as the North was reached until from Stockton up not more than a trace of rainfall has been noted so far this season. Of course, there is ample time yet for early rains, but it is getting along toward the season when we begin to look solicitously at the rising clouds.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.
